A Christmas present that endures...

The gift of a Zeiss Ikon camera gives lasting pleasure—not only now, but also in the future. The Zeiss Ikon trade mark on an instrument is synonymous with craftsmanship and quality the world over, and such a gift is one that the most fastidious photographer will appreciate.

Remember that good quality Zeiss Ikon cameras which can be used right away to take first-class pictures in the winter can be obtained for as little as £2 12s. 6d., while £60 or more may be paid for that wonderful modern miniature—the Contax.

The whole range of cameras is described in the new illustrated book "Round the clock with Zeiss Ikon Cameras", which also shows the sort of pictures which can be taken during the winter, both by day and by night. Copies will be sent post free on request.

All Zeiss Ikon cameras fitted with Compur shutters or over £10 in value, sold at current listed prices in Great Britain and Ireland, carry a written guarantee for three years. Ask your dealer for particulars.

"THE A.P." EXPOSURE GUIDE FOR ARTIFICIAL LIGHT

Even quite expert photographers, completely at home with their exposures when operating in day-light, are liable to find themselves at a loss to know what exposures to give when using artificial light. More photographs than ever before will be taken by electric light this winter, and in the absence of a sensitive photo-electric meter the tables below will provide a really reliable guide to exposure.

METHOD OF USE. First find in Table I the name of the film being used, and note the number at the head of the class including it. To this add in succession the number given in Table II for the wattage of the light being used, the number from Table III corresponding to the distance of the light from the subject, and that from Table IV corresponding to the stop in use. The exposure required will be found in Table V opposite the total so found.

EXAMPLE. A portrait is to be taken on Selo Hyper-sensitive Pan. film by the light of two Photoflood lamps placed at 5 feet from the sitter. Stop to be used, f/4.5. From Table I the film has the factor 0. From Table II two Photofloods (or 1,600 watts) have factor 2, making the total (0+2) up to 2. The distance, 5 feet (Table III) adds 9, bringing the total (2+9) up to 11. The stop in Table IV adds a further 7, making the total now (11+7)=18. Reference to Table V shows that the required exposure is 1/16th second.

ADDITIONAL NOTES ON THE TABLES.**NON-STANDARD LAMPS.**

If opal instead of pearl lamps are used to get softer lighting, add 1 to the total before using Table V. If Nitraphot lamps are used, subtract 2 from the total.

NO REFLECTORS. Where reflectors are not used, add an extra 2 to the total before using Table V.

DIFFUSERS. If a diffuser is used in front of the lamp, again add an extra 2 to the total before using Table V.

SEVERAL LAMPS AT DIFFERENT DISTANCES.

If several lamps are used, and are placed at different distances from the sitter, to be strictly correct it is necessary to work out separately the contribution made by each to the total illumination. It would be easy to provide a table to enable this to be done if desired, but for all normal purposes this refinement of accuracy is quite unnecessary, and it is sufficient to expose as though the main light (i.e., the one that throws the most light on the sitter) were the only one, regarding the lesser lamp or lamps as being no more than a means of ensuring that the exposure shall be fully adequate for the shadows.

The main light for this purpose is not necessarily the bulb of highest power, but is the one for which the figures from Tables II and III (and Table VI if the light comes very much from side or top) add up to the smallest total. If two lights give the same total,

it will be safe to give half the exposure correct for either of them alone.

EXAMPLE. A sitter is lighted by a Photoflood in reflector at 5 ft., angle about 35 degrees. This light is augmented by a 500-watt Nitraphot in reflector at 7 ft. (full frontal lighting), by a 100-watt opal lamp without reflector at 4 ft. at an angle of 50 degrees, and by a second Photoflood in reflector at 4 ft. at 75 degrees. What exposure is required on Selo F.G. Pan. film at f/4.5?

From Tables II, III and VI the figures for the four lights are:—

First Photoflood 4+ 9+0 = 13

Nitraphot 3+11+0 = 14

Opal lamp 10+ 8+1 = 19. Add 2 for lack of reflector, and 1 for opal lamp; makes effective total 22.

Second Photoflood 4+ 8+6 = 18

The main light is evidently the first Photoflood, with the Nitraphot a close second. On the basis of the Photoflood only, the required exposure would be 1/32 second (values from Tables I and IV are 2 and 7 respectively, making a total of 22). Since there is so much extra light about, and particularly as the Nitraphot gives almost as much light as the Photoflood, it would probably be safe to halve this exposure and give 1/64 second.

TABLE VI. ANGLE OF MAIN LIGHTING.

Angle.	Factor.
Up to 45 degrees	0
45 to 50	1
50 to 60	2
60 to 70	4
70 to 80	6

It should be observed that these figures are necessarily only approximate, since the exposure required will depend on the surroundings, which determine the amount of reflected light reaching the shadows. The above figures are about right for an ordinary light room.

Mounting Photographs on Wood

By R. DIXON.

A NOVELTY FOR CHRISTMAS PRESENTS

READERS who are on the look-out for an unusual method of treating their photographs for seasonable greetings should try mounting enlargements on wood. The process is quite easy and enables a great variety of effects to be obtained.

The simplest method is to glue them flat on to a rectangular panel of fretwood, fitted with a piece of silk cord for hanging on a wall or attached to a miniature easel for standing on a piano or cabinet top. In some cases a pleasing effect can be obtained with round or oval panels, cut to shape with the aid of a fret-saw. In the case of figure studies an alternative method which will make them stand out in bold relief is to glue the print on to a piece of fretwood and cut out the figure in outline. The cut-out is then mounted on a panel of nicely-grained wood, such as oak.

The next suggestion is for those readers who have young children. Most children's cots are decorated with nursery rhyme transfers. After a time they tire of looking at these, but if suitable holiday photographs are pasted over the transfers they are delighted, particularly if some simple rhymes are made up about the pictures.

Another interesting pastime is the making of little statuettes from suitable photographs; and these may be constructed

Holiday snapshots are excellent for decorating a child's cot, especially if some simple rhymes are made up about them.

Attractive book-ends can be made with the aid of suitable photographs, some wood and a fret-saw.

A home-made letter rack incorporating a holiday snapshot.

lines may be made to take the form of book-ends, letter racks, etc.

For the guidance of readers who have no previous experience of fretwork, a few notes on the most suitable kinds of wood to use are appended. Plywood is very cheap, and panels made from it look quite nice when stained; but it is not recommended for use in making such articles as book-ends, and the unsightly edges of the wood would be too prominent. Satin walnut is an inexpensive wood of a soft brown colour, whilst sycamore is a white wood. Oak and mahogany (whose characteristics are well known) are more expensive; but Spanish chestnut is a good substitute for

light oak, being similar in appearance whilst easier to cut and cheaper to buy. Readers who have difficulty in obtaining any of these materials locally should write to Hobbies, Ltd., Dereham, Norfolk. As regards a finish to apply to the wood, any ironmonger will be able to supply a variety of easily applied varnish stains, lacquers, etc., whilst more experienced workers may care to try their

hands at french polishing. In many cases, where such woods as oak have been used, a pleasing effect is obtained without any such after-treatment.

Readers must decide for themselves just how they will treat their own photographs; but the illustrations to this article give a good idea of the kind of work which can be accomplished, and they should have no difficulty in obtaining some pleasing results that will be appreciated for their personal quality at this time of year.

Novel statuettes can be made in the form of calendars, ring-stands, etc.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDXV.

Mr. ERIC
BRAMALL.

From information communicated to our Special Representative.

"WHEN I first began to take a serious interest in photography, and to pay regular visits to the chief London exhibitions, I was struck by the evident fact that most of the best-known photographers specialise in one particular class of subject. Anyone who looks through several volumes of *Photograms of the Year* will realise that this is certainly the case; and therefore I decided to concentrate my attention on portraits of boys and young men. Being a schoolmaster by profession I have no difficulty in finding subjects, and also I have plenty of opportunity to study types and individual characteristics.

"Good portraiture is largely, perhaps almost entirely, a matter of correct lighting, and, although quite astonishing things can be done with a couple of Photofloods in an ordinary room, I regard a permanent studio, fully equipped with lights, as an essential.

"At the back of my own studio, which is a room measuring 20 by 11 feet, I have two Kodak Unit lights, each with 1,000-watt bulbs. These provide the main general light when one is required. Then I have two Ensign Multilites, mounted on extending tripods which can easily be moved to any part of the studio. For special effects I have a spotlight, and a top-light hanging from the ceiling; and there are four Photofloods which can be fixed in any part of the studio for such auxiliary lighting as may be necessary. Of course, all this lighting is never needed at the same time! In my opinion many amateur portraitists are inclined to use far too much light. Correct balance of light, and not mere quantity, is the important thing.

"Another essential for good portraiture is a long-focus lens. My criticism of the majority of portraits taken with miniature cameras and short-focus lenses is that they distort the true perspective of the face.

"I use a quarter-plate Thornton-Pickard reflex with a Dallmeyer f/6 telephoto lens with a focal length of 12 in., and a six-foot shutter release. I prefer plates to films for this work, and generally use Ilford Soft Gradation Panchromatic. I give a brief bulb exposure with the lens at full aperture. All my negatives are developed by the time and temperature method, using Azol in a tank.

"For exhibition prints I usually enlarge to 15 x 12 on Gevaluxe, or on one of the Ilford or Kodak bromide papers. I like Gevaluxe the best in most ways, but the finished prints require very careful handling, and they do not always receive it when going the rounds of the exhibitions.

"Although I specialise in boy-portraiture I do not confine myself to it exclusively. For outdoor work I use a 6 x 6 cm. Rolleiflex; I do not like using anything smaller, and 6 x 6 cm. is an excellent size for making lantern slides by contact. I also use it for Dufay colour work.

"In addition I have periodic waves of enthusiasm for making stereoscopic transparencies, and for this branch of work I use a 13 x 6 cm. plate camera fitted with a pair of f/4.5 Zeiss Tessars.

"If amateur portraitists want a word of advice, I would say: 'Study portraits by first-class photographers; examine the lighting and composition; and go and have your own photograph taken by someone really good, quietly observing his methods.' An hour spent in the studio of someone like Mr. Howard Coster is worth days of theoretical study. Much can be learnt, too, from textbooks."

(A further example of Mr. Bramall's work is reproduced on one of the centre Art pages.)

THE YOUNG ARTIST.

Eric Bramall.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"WINTER SPORT," by H. W. Berger.

WHETHER the subject of this picture is of the same opinion or not, there is little doubt but that the unfortunate spill has provided the photographer with a fortunate opportunity for securing a winter study out of doors which possesses features of attraction that might not have been feasible had the figure been in motion.

The image is clear-cut and sharp and beautifully defined against its setting of broken and unbroken snow, whereas, had the figure been taken at speed, it is highly improbable that it would have been shown without some deficiency in definition, and it is scarcely likely that so much would have been made of the play of sunlight and shadow on the broken surface in the foreground. If the figure were moving quickly, it would be necessary, in order to avoid subject movement, to follow its direction with the camera and make the exposure when the figure was at the right distance, in a favourable pose, and, as far as possible, in harmony in the setting.

But getting the figure would be the prime consideration. There would be small chance of giving any thought to, or arranging for, the inclusion of an effect of sun and shade on broken snow, and if, by a stroke of luck, such a thing did happen, it would be highly probable that most of its virtue would be lost by movement of the image through the figure being followed by the camera.

On the other hand, if the setting were pre-selected, and the point of view were stationary, movement of the figure itself would be almost inevitable. One or the other of these drawbacks could scarcely be avoided even with the shortest of practicable shutter speeds. With a spill, however, motion is temporarily arrested, but, while there is still a need for rapidity of action, it is not so urgent and there is time for a swift glance round with a view to assessing the possibilities of the subject. It would have to be

more or less instinctive and very sure, or the spirit of the theme would be lost, but, once the mind had been made up, the exposure could be made without fear of subject movement.

And here, I think, the most has been made of the opportunity. There is a very joyous and jolly expression on the features, which not only shows that the spill has been taken as a

Switzerland and other places on the Continent for the winter sports, and though, in an exceptional season, something of the sort may be attempted at home, it is seldom indeed that there is really either a sufficient depth of snow or an adequate space to provide a ski-ground.

Occasionally, we do get a fairly heavy fall, and, while tobogganing and sleighing might offer chances of a character that are somewhat akin to this, the possibility is somewhat remote. What chances there are need not be missed, but, in my opinion, it would be preferable to try and see what can be done with winter landscape without the complications arising from the introduction of figures, for it does allow the necessary time for contemplation, and finer pictures can be made with the leisured care and forethought that can be exercised than the smartest piece of speed work, however cleverly achieved. Again, the season of Christmas provides opportunities for indoor work—what with family reunions, festivities, and the few days of holiday—that all photographers can enjoy. The recent introduction of Photo-flood lamps used in conjunction with large-aperture lenses and emulsions of phenomenal speed has vastly enlarged the scope of work that can be tried at home, and, if portraiture does not appeal and family groups make one tired, there is always "still life" and the hermits can creep away into their dark-rooms and be at rest.

And, in all probability, I shall be numbered among the latter, for I have still some prints to make for next year's shows, and the few days of holiday give me the time to do them in a reasonably leisurely manner.

No doubt many of my readers will do likewise, but wherever you are and whatever you do, you have my wishes for the best that the season can offer and the most cordial wishes for the coming year. "MENTOR."

joke, but is also indicative of the spirit of the season when the peace and goodwill of Christmastide create a universal feeling of friendliness and conviviality. That expression has its counterpart in the brightness and glow that the snow in sunshine suggests, while the shadows and interstices of the foreground, with their attractive play of light and shade, lend a measure of variety and complete a very well ordered theme.

However, not all of us are so favourably situated that the chance of making pictures of this kind comes within our scope. Comparatively few are able to visit the snowfields of

PETER.

PICTURES by Novices

*SOME CRITICAL COMMENTS on
the Beginners' prints reproduced on the opposite page.*

IT may be something of an anomaly, but it is seldom possible to make good pictures of snow or get the slightest idea of its beauty without an accompanying effect of bright sunshine or a real thorough-paced effect of storm. It is only on the rarest of occasions, if ever, that anything of a pictorial nature can be achieved when the weather conditions are dull and heavy with the promise of more snow to come, and not a gleam of brightness exists.

Snow and Sunshine.

That the fact has been appreciated seems to be evident from the collection of prints reproduced on the opposite page. They are very bright and lively, and, in the main, they show a very good idea of the sort of thing to strive for.

No. 8, "Winter," by H. E. Iles, is a good example, except for the fact that the background is somewhat cluttered up with an excess of tree trunks. The foreground, with its patterned light and shade, is very attractive and the isolated tree on the left makes a strong note that acts as a useful centre of interest. It stresses the delicacy of the gradations on the right, and, on the whole, the sunlight and the texture of the snow are admirably suggested.

If, however, a further band of shadow tone could have been found to run along the base line, somewhat after the manner that the shadow of the tree does above, the light beyond would have been emphasised and the value of the sunshine increased. But, as far as can be seen, there is little promise of anything of the sort, although, perhaps, a little scouting around might have found it.

The Value of Shadows.

No. 1, "Over the Hill," by Miss Evelyn Williams, does better in this respect, and the foreground shadow is extremely useful. It is rather exaggerated, all the same, and its effect would be just as good if half an inch of it were trimmed away, but it does show how much a shadow along the bottom throws up the light beyond and something of the sort would have been the making of No. 8.

A rather different state of affairs is to be seen in No. 2, "Winter Sun-

shine," by C. W. D. Phillips, where the subject is seen against the light, and the shadows, instead of running across the picture, fall towards the viewer. The idea is quite effective, and is as capable of revealing snow and sunshine as in either of the former cases, but, to my mind, too much is made of the trees and not enough of the snow.

Moreover, on account of a tendency towards excess of contrast, much of the lighter gradation seems to be missing. The only effective way of reducing the insistence of the trees is by reducing their scale and this means a greater viewing distance. It is possible, too, that a greater proportion of space could be allotted to the foreground, for, with the shadows running downwards, there is not the same need for limiting their extent as there is with No. 1, but these are matters which necessarily involve another shot, the chance for which may not arise for some little time.

It is different with the question of gradation, for it simply means the substitution of a softer grade of printing paper in place of that employed. It would enable a greater measure of modulation to be recorded in the lights without rendering the darks in too heavy a key.

Subtlety of Tone.

Much of the beauty of snow depends on the subtlety of tone in the rendering of the differences between the portions in sunshine and those in shade—a fact which is very forcibly demonstrated in the picture I have discussed on the preceding page, "Winter Sport," where a good deal of the charm arises from the tumbled nature of the snow in the foreground—and it is this sort of thing that it is important not to lose.

It might well be the case that the change in printing paper would enable a similar range of tone to be shown in No. 2, if not quite to the same extent, but with No. 3, "Snow Shadows," by John Goddard, where the tones and their range seem just about right, I am inclined to think that the snow is too fresh for any such breaks to have made their appearance, for, judging from the remainder, they would have been fully recorded had they been present. What might have been done, and what I should do myself,

would be to make a few footprints—running into the picture—that would provide some marked depression in the surface that would make notes of shadow and points of light to break up the even tone of the foreground.

Winter Landscape.

Nos. 6 and 7, "Winter," by A. W. Harttree, and "Winter Wonderland," by John H. Lee, are rather too small for me to see whether there is anything of a similar nature about them, but, speaking generally, it is possible that enlargement might display a desirable measure of modulation in the foreground, and, if so, it might well be tried.

Here again, too much is made of the trees and not enough of the foreground, and in nine cases out of ten it is the foreground that is the making of pictures of snow.

Wide-open types of landscape of the nature of No. 9, "Winter," by L. V. Headley, are rarely successful, and, even with sunshine, they seldom attain the attraction of subjects which are made from objects nearer to hand like Nos. 2, 3, and 8. No. 9 is no exception, and, though it might be said to be well composed, it is dull and gloomy and it is very doubtful indeed if anything could be done to give it life.

The sunset, rather than the snow, is the feature of No. 4, "A Winter's Eve," by G. M. Robinson, and the winter aspect is more or less incidental. But I am inclined to doubt if, in this instance, the most has been made of the subject, for, while the rendering of the sky is tolerable, the wiriness of the tree branches makes the landscape very "busy," and it scarcely harmonises with the sky above.

Choice of Theme.

The mist in No. 5, "The Lagan Canal; Belfast," by John J. Cowley, affords some improvement in the rendering, the twigs being shown in tones of grey against the soft tone of the sky, and the distance being massed.

But the open nature of the subject, once again, prevents it achieving the same sort of attraction that the foreground studies show, and, taking it all round, I think the far better plan with such snow scenes that we are likely to get is to restrict our efforts to the subjects nearer at hand. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Under this heading we publish every week an article dealing with topics of interest to the novice. Something has gone wrong with this one, but we expect that next week the series will resume its usual monotony.

JONES GOES MINIATURE.

UNLESS I am confusing Figs. 1 and 2, the former is a portrait of Jones. His real name is not Jones at all, but Mopswizzler, which sounds so unconvincing that it would lay me open to suspicion of inventing him. The portrait shows Jones as he might have been seen at almost any time during the summer season, which, as we all know, extended this year from 10.5 a.m. to 2.7 p.m. on February 30th.

For years he often swung thus along the countryside from inn to inn, as he took a special interest in inn insides, and outside signs. He thought nothing or less of carrying with him a camera so large that it yielded negatives $3\frac{1}{4} \times 2\frac{1}{4}$ (Avoir. weight), and his prints were so distinctive that it was often possible to distinguish the sign of the "Flayed Weevil" from that of the "Gamp and Gallows." His interiors of bar parlours by night were definitely inferior.

On or about the Ides of March, something happened to Jones. He became obsessed by portraits appearing in the papers, and the more obsessed he became the more obsessed he was. He suspected that at least some of them, if not more, were what

Fig. 1.

he had heard described as "candid" portraits. He easily thought of other epithets for them, and once inadvertently said one aloud, whereupon the landlord told him that a repetition of the offence would result in his prompt and forcible ejection.

But by degrees Jones began to see something in the portraits—not much,

but something. They left almost everything to the imagination, because there were no features, and he could visualise the persons at will as film stars, all-in wrestlers or double-breasted nightmares. He began to cut them out and make groups of them (e.g., Fig. 4) and try to name them. For one portrait alone he got 117 possible names at a single sitting, but he found afterwards that this one was the Battersea Power Station by night.

Then Jones began to make enquiries about the production of candid, etc., portraiture, and during the a.m. of Guy Fawkes Day he took $\frac{1}{8}$ and a resolution. The former was one over

Fig. 3.

the eight, and the latter was to go miniature. He gave his camera to the potman, and went miniature and home. He kept his collection of portraits to give him something to aim at—sometimes playfully with darts, and sometimes more purposefully with tankards.

He also began to make other groups

Fig. 2.

Fig. 4.

like that in Fig. 2, which I now recognise as being different in some respects from Fig. 1. He would shut his eyes, turn round three times, jab a cork-screw into the diagram, open his eyes, and say, "Now, Jones, do you know what this is?" And then he would answer, "This, my dear Jones, is a hundred per cent range-finder, electric meter and shutter-diaphragm-focus control combined. It prevents your taking anything but a hundred per cent exposure, but it will not wash bed-socks." Even if his answer was wrong Jones never told himself so, as he found it made him sulky, and liable to fizzle the next stab with the cork-screw.

Early on the morning of December 25th, 1937, he woke, switched on the light, and rang for the maid. She brought in, one by one, 099 parcels, each with a label on which were such inscriptions as "xxx Darling Jonesy, from Muriel xxx," and "To One

of the Best from Himself." (Fig. 3.) He did not hasten to open them as he knew the contents were a few preliminary gadgets for his miniature work. He had bought and addressed them himself, and in his enthusiasm he cheerfully ignored the resultant overdraft on his banking account. He also knew that his miniature

camera was in its crate in the garage, as he had himself helped the two men to lift it off the lorry.

It gave him a sharp attack of inferiority complex to remember that he had once been a two-bottle man; not—most certainly not—in his exploration of the hostilities of his own and other lands, but in his photography. He had done all his work so far with a bottle of single-solution developer and a bottle of hypo. The negatives seemed good, too, until he heard about "grain," and looked at them under a high-power microscope. Then he threw the lot on the fire, and the insurance people would not pay up, because they said it was clearly a case of deliberate arson.

But now he saw in his mind's eye the preparations he had made in the basement, the same eye wandering over the whole gorgeous chemical and accessorial array, and not merely over the insignificant backwater in Fig. 5.

He felt like an outsize Boy Scout—he was prepared! Jones's candid portraits should astonish the world, and his miniature prints should be a hundred per cent the largest ever.

And here for the present I leave Jones. I hope none of you will be foolish enough to suggest that it was impossible for me to tell you on December 8th what Jones did on December 25th following; for had it been impossible I could not have done

Fig. 5.

it; and I have. But I admit that his real name is not Jones, but Mop-swizzler. Perhaps that accounts for it. Or doesn't it?

Anyhow, here's all the best for Xmas. "THE WALRUS."

THE AWARDS IN OUR THIRD ANNUAL NOVICES' COMPETITION

THE popularity of this Annual Competition steadily increases, and while last year we considered the number of entries a record in amateur photographic competitions up to that time, it has been easily surpassed this year.

From the thousands of prints entered we have realised not only the widespread vogue of amateur photography, but also the world-wide circulation of *The Amateur Photographer*, as prints have reached us from all parts of the globe. On this occasion, also, in view of the enormous number of miniature cameras in use, it was decided not to restrict the entries to contact prints as previously, but to permit small enlargements to be submitted, either mounted or unmounted.

Prints of all shapes and subjects were entered, and the bulk of them were naturally summer holiday snapshots, a very large proportion of which were extremely good in quality, both technically and pictorially. This increased the difficulties of judging, but every print was carefully examined, and after the first "weeding-out" the remainder were scrutinised again and again until we arrived at the final decision.

The awards are as follows:—

FIRST PRIZE (two roll films every week for one year): "The Summit," David Wilton, 38, Richmond Hill, Bournemouth, Hants.

SECOND PRIZE (two roll films every week for six months): "Clouds and the Windmill," Miss H. Lloyd, 15, Chapelhill Road, Moreton, Cheshire.

THIRD PRIZE (one roll film every week for six months): "The End of the Day," R. Davis, 25, Trevor Street, Aberdeen, Glam.

TWELVE PRIZES of one roll film every week for three

months: "Autumn Sunshine," E. A. James, 43, Penrhyn Road, Kingston-on-Thames; "Portrait," H. J. Nott, 274, Lytton Blvd., Toronto, Canada; "From Cask to Bottle," V. Berruto, 21, Poplar Walk, Herne Hill, S.E.24; "Portrait of a Tabby Cat," Raymond Roberts, 7, St. Jude's Court, Wolverhampton; "Having a Good Spring Clean," G. Sommerfeld, 115, Haverstock Hill, London, N.W.3; "Trafalgar Square," A. J. Freeman, 35, Salisbury Avenue, St. Albans, Herts; "The Well," W. F. C. Holman, 12, Hardwick Road, Eastbourne, Sussex; "Peter," Capt. T. R. Wall, c/o Grindlay & Co., Bombay, India; "Forty Winks," C. S. Brown, 161, Princes Avenue, Palmers Green, N.13; "Windswept," I. Mathias, 25, Waldegrave Avenue, Hull; "Daddy's Tobacco Jar," R. E. Potter, Bow Green Road, Bowdon, Cheshire; "Autumn Clouds," F. J. Ciniglio, 12, Bush Grove, Stanmore, Middx.

The following prints were the runners-up in the final selection, and we have decided to award each of them a special certificate of merit:—

"Fishers," E. Gibbs (Agra, India); "Conger Fishing," A. H. Zair (Ludlow); "Five Little Maids at School," J. H. Etheridge (Wolverhampton); "Walls and the Girl," B. A. Kirk (London, W.); "Down to the Sea," Leslie W. Lawley (Ryde, I.O.W.); "What Next?" James Hunter (Kirkcaldy); "The Hairdresser," Jack Lyons (Kilkilly, Co. Mayo); "Stop for Lunch," L. F. Barham (Falmouth); "Cochem," R. N. Vane (London, N.W.); "That's the Way," A. C. Spenceley (Gillingham); "She Who Hesitates," J. N. Hensley (Sheffield); "Beachcombers," Miss N. Lloyd (Southampton); "Please God" (Little Refugee's Prayer), V. A. Tootal (Blackpool); "Further Outlook," A. F. Boucher (Frinton-on-Sea); "Home-

ward Bound," H. Robbie (Cartly); "Seen from Above," L. E. Pettitt (London, N.); "Sandy," H. Watson (Argyll); "Pack Horse Bridge," P. W. Brook (Prestwich); "When Work is Done," John Hughes (Haswell, Durham); "Mr. Penny, in the Office," B. Stott (Widnes, Lancs); "A Thirst Quencher," W. H. Hawkin (Runcorn); "Youth Hostelling," F. C. Wellum (Stechford, Birmingham); "The Picture Paper," M. Cullishaw (Nottingham); "Tip Top," Wm. Russell (Glasgow); "Patchwork," H. Robinson (Derby); "Karwendel Mountains, Tyrol," D. G. Forbes (Croydon); "Carefree," James Dempster (Leith); "The Tidal Pool," W. R. Holmes (Chepstow); "Sunset on the Nile," Corporal Jackson (Khartoum); "Portrait," J. Davies (Scunthorpe); "Guy's Cliffe Mill," W. Coombs (Leicester); "Harvesting in the Cotswolds," W. A. Beer (Dursley, Glos); "Monday Morning," John Watson (Wellington, N.Z.); "Over the Top," W. Rees (Harrow); "Interest," R. Thurgood (Oxford); "The Devil's Tooth," W. T. Shaw (Johannesburg); "Joy of Youth," R. Bates (Lincoln); "I Looked Through the Life Belt," H. G. Grieve (Glasgow); "The Reaping Team," R. P. Williams (Ryhope, Co. Durham); "Kerbstones in Embryo," E. M. Patterson (Bangor); "Rich and Rare," Miss M. Robertson (Sunderland); "Look Up," Tan Swee Kim (Perak, Malaya); "You Wash My Back," Percy Donald (Edinburgh); "The Fountain, Worms, Germany," R. J. Lacey (London, S.E.); "Portree Bay," Miss E. Nicol (Aberdeen); "A Novice of the Fiddle," C. P. Tang (London, S.W.); "Accounts," R. S. Hodges (Felixstowe); "My Pet," R. J. Feven (Bristol); "Marble Cliffs," Tan Teik Oi (Kampak, Malaya); "Evening Sunlight," John S. Dick (Glasgow); "Holiday Miss," W. G. S. Wright (Portadown, N. Ireland).

MAKING BETTER SNAPSHOTS-27

By DAVID CHARLES.

This article is the twenty-seventh of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

THE keynote of the Christmas holiday, from the amateur photographer's point of view, is I think, its unusualness. In several respects it is quite different from any other time of year, and in those ways can prove helpful to the making of interesting photographs.

Fig. 2. The spirit of the time makes successful "candid camera" results fairly easy to secure.

In the first place, it is the time when everyone makes a point of relaxing from the artificial reserve of modern civilisation. In other words, people suddenly become happily "themselves." In that state it becomes possible to portray them in their real likeness with a total absence of the tremendous effort that at other times is required to forget self-consciousness. This effort on the part of both photographer and photographee is much more exacting, usually, than all the rest of both the art and the technique which go to the making of a characteristic likeness.

But here we have a unique occasion when people leave their "masks" behind them. Whether one invites them to face the lens, or one prefers to stalk them with the aid of one's candid camera, they are sure to be in the state most likely to result in happy, likeable portraits. In the ordinary way it might be considered almost an absurd procedure to hide behind a curtain for the purpose of attempting indoor "candid camera" portraiture of one's friends and

relatives. Detection of one's "nefarious" intentions would be probably swift, and indignation might be aroused. But on this one occasion all one's proposed victims are so engrossed in their various occupations or conversations that detection is likely to be deferred for quite a time, and will be regarded as a joke even when it comes.

The Surreptitious Photoflood.

For the benefit of those who are not so grandiloquently equipped with apparatus as they could wish, let me point out that a Photoflood bulb can very easily be substituted for one of the ordinary room lights. After the extra brilliance has been appreciatively commented on, it will soon be forgotten in the light of successive superior attractions. If it is possible to rig up in advance a couple of Photofloods in judicious positions good slow shutter results are fairly certain.

But I would add a strong caution against the use of flashpowder at Christmas festivities. It is the customary presence of masses of tissue-paper "decorations" which introduces a very great element of danger to the use of any form of "fireworks." To flashbulbs, of

Fig. 1. Placid contentment makes for characteristic portraits, often treasured above the posed artificiality of more sophisticated productions.

recording on paper some of these scenes of unwonted peacefulness is one which will appeal to many.

Watch for Condensation.

Whether one sets out to make seasonable views, by day or by night, or if one is a visitor arriving to festive celebrations, there is a trouble which may occur without one's knowledge until the useless negatives are developed! Every schoolboy knows the experiment of carrying a glass of cold water into a heated room to watch the rapid condensation of water on it. But not everyone thinks of the same effect occurring on the surface of his lens. Let it dry before using the camera.

Fig. 3. Outdoor scenes like this are constantly changing, needing rapidly in both eye and shutter.

course, no such objection arises.

Another quite different point of "unusualness" that will appeal at Christmas-time to many photographers is the practically complete cessation for a substantial period of normal traffic. There is a tremendous sense of peace which descends upon the whole business world, where normally life whirls by for nearly twenty-four hours per day. The idea of

Fig. 4. But other places, like this suburban road, may show quite unwonted peacefulness

GONE TO THE WAR

Many are the people who have missed the familiar figure of Eugene recently from our developing and printing department. Many are they who have looked in vain to find the cheerful face of Peter J. Davis in our R. G. Lewis (Ciné) showroom. Search no more, ladies! Seek no more, sirs! These twain are by now somewhere along the Spanish front.

Eugene has taken a Leica IIIa, with a battery of lenses and filters. Peter has taken a Leica, too, but only for incidental work, as he is engaged in making a ciné film.

Spain has always been one of the Old Man's photographic happy hunting grounds, and he has so constantly bemoaned the cruel chain of circumstance that has prevented him from visiting Spain during the last year or so that Eugene determined that someone in "202" must go. Eugene accompanied R. G. L. on the canoe trip through Spain which resulted in "Spanish Adventure," and feeling that he was therefore best fitted for the job, he decided to go again to record on film, as he so ably can, what is happening there.

We feel sure that all who know these two miniaturists will join with us in wishing them a successful visit and a safe return. P. J. D. may take up film production after the trip, but Eugene's famous smile will, we hope, soon be seen again by those who come to "Try 202 for Service."

WET FROM THE PRESS

At the same time as this issue of "The A.P." is offered for sale, we expect to receive from our printers the second edition of "Miniature Enlargers and Accessories." Last year's edition ran into several re-prints, and this year's, we predict, will be in even greater demand, as more enlargers are included, and a more attractive introduction has been written—reminiscent, as a matter of fact, of our "A.P." style.

The make-up, too, is definitely more attractive, and, quite frankly, all those at all interested in enlarging should obtain a copy, as every miniature enlarger of repute is dealt with in this issue. Your copy will be sent free and post free upon request, but don't leave your application until to-morrow, or you may forget.

JUST A FEW LEFT

We have still a few of the Balda cameras referred to last week, but these are going so quickly that we cannot hope to be able to supply for any length of time now. These are the very latest Balda models for 16 on 3½×2½, fitted with f/4.5 Trioplan and Prontor II shutter, complete in carton with instructions. The list price is £2 2s. 6d., and our price is £4 10s.

"SILLY OLD SILLIES!"

That is what our favourite typist calls the miniaturists who say, "I couldn't bear to tie myself down to the responsibility of monthly payments—I'd rather be without a camera!"

"What," she asks, "about the monthly rent? Your children's school fees? The rates and taxes?"

"Why," she demands, "do you not shirk those responsibilities? And why, if you are cheerfully bearing them, do you deny yourself the pleasure of using apparatus that you yearn for, when the purchase of such apparatus could be so easily arranged by our hire purchase scheme?" For your art's sake, do not let "H.P. inhibition" (as we label the disease) stand in the light of your progress in miniaturism. Write to us to-day, and discuss your particular problems with us.

A GUARANTEE,

when issued by a firm that prides itself on its straightforward and honourable dealing, gives a feeling of security to the purchaser that it would be difficult to put into words. All miniature apparatus sold by us is guaranteed against any defect whatever for one year from the date of purchase, and indefinitely after expiration of that period against any inherent defect. So, when buying your next camera, why not "Buy 'Lewis' and Buy Safe!"

LEICAS:

Leica III, f/1.5 Plasmal, coupled. Excellent condition £37 10 6
Leica III, chromium, f/2 Summar, E.R. case. As new £32 10 0
Leica III, black, f/2 Summar, E.R. case. As new £31 10 0
Leica II, chromium, f/3.5 Elmar. Indistinguishable from new. £22 15 0
Leica II, black, f/3.5 Elmar, E.R. case. Practically as new £19 10 0
7.3-cm. f/1.9 Hektor Lens, latest rectilinear focussing. As new £19 17 6
Another, as above, but non-rectilinear. Excellent condition £17 17 6
4-cm. f/1.5 Meyer Plasmal, for Leica. As new £10 17 6
5-cm. f/2 Summar. As new, nickel. £13 10 0
Leitz Varyl Enlarger, for negatives up to 6×6 cm. with lens. Good condition. £14 15 0

CONTAXES:

Contax II, f/2 Sonnar, E.R. case. As new. £39 10 0
Contax I, slow-speeds model, fitted new-type collapsible f/2 Sonnar. As new. £29 15 0
8.5-cm. f/4 Triotar for the Contax, any model. As new £11 15 0
4-cm. f/2 Biotar for Contax. As new. £12 10 0
Contax III, f/1.5 Sonnar, case. As new £65 0 0
Another, as above, but with f/2 Sonnar and case £52 10 0
Large Reproduction Apparatus for Contax 1454/28, complete with three lenses 995/32. As new £11 15 0
Zeiss Magniphot Enlarger, new model, with lens. As new £9 10 0

THE MINIATURE NEWS AND TIPS DEPARTMENT

has been transferred this week to our advertisement on page 21.

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS:

531 Super Ikonta, f/3.5 Tessar and Rapid Compur, E.R. case. As new. £16 17 6
Kodak Regent, f/4.5 Tessar, case. As new £13 18 6
Dollina II, f/2 Xenon, Rapid Compur. As new £15 15 0
Dollina III, f/2.8 Xenon, Compur. As new £13 17 6
Super Nettel I, f/2.8 Tessar. As new. £17 15 0
Ensign Autorange, f/3.8 Tessar, Rapid Compur. As new £15 15 0
Super Ikonta 531/2, f/3.8 Tessar, Rapid Compur. Albada finder, etc. As new. £19 10 0
Super Ikonta 530/16, f/3.5 Tessar. As new £18 17 6
Weltini, latest chromium model, combined view and range finders, body release, f/2 Xenon. As new £20 5 0
Another, as above, but fitted f/2.8 Tessar. As new £18 17 6
Another, as above, but fitted f/2.8 Xenon. As new £16 17 6
Super Ikonta 530, f/3.5 Tessar, Normal Compur. Excellent condition. £13 10 0
Peggy Model II, f/3.5 Tessar. Excellent condition £14 10 0
Latest Chromium Weltur (16 on 3½×2½), f/2.8 Tessar, combined view and range finder. As new £18 12 6
Another, as above, with Rapid Compur. £19 10 0
Ensign Multex II, f/6.3 Multar, case. As new £14 15 0
Weltur, f/2.8 Tessar, Rapid Compur. As new £19 10 0

MINIATURE REFLEXES:

Contaflex, fitted f/1.5 Sonnar, complete with E.R. case. As new £49 10 0
Exakta Model B, f/2.8 Tessar. Condition as new £21 15 0
Exakta Model B, f/2.8 Tessar, non-lever-wind. Excellent condition. £20 10 0
Exakta Model B, f/3.5 Exaktar, non-lever-wind. Excellent condition. £14 15 0
Exakta Model A, f/3.5 Exaktar. Good condition £11 15 0

MINIATURE REFLEXES—contd.:

Kine-Exakta, f/3.5 Exaktar, 13.5-cm. f/4 Sonnar, chromium, 4-in. f/5.5 Ross Teleros (chromium), 5 Leitz extension tubes for portraiture and copying. Leitz lens hood. Cost £67. All absolutely as new £45 0 0

12-cm. f/6.3 Tele-Tessar for the Exakta. As new £10 10 0
Kine-Exakta, f/2.8 Tessar, case. As new. £29 17 6
Reflex-Korelle I, f/2.8 Tessar. As new. £15 15 0
Reflex-Korelle II, f/3.5 Tessar. As new. £16 15 0
Automatic Rolleiflex 6×6, f/3.5 Tessar, case. As new £17 10 0
Another, as above, f/3.8 Tessar, case. As new. £14 17 6
Another, as above, f/4.5 Tessar. As new. £13 10 0
Rolleicord I, f/4.5 Tessar, case. Good condition £7 10 0
Rolleicord I, f/3.8 Triotar. Practically as new £10 10 0
Ikoflex II, f/3.5 Triotar, E.R. case. As new. £12 17 6
Pilot Reflex, f/2.8 Tessar, Compur. Good condition £12 15 0
Voigtlander Brilliant, f/4.5 Skopar, Compur Rapid. As new £5 0 0
Voigtlander Superb, f/3.5 Heliar, case. As new £14 5 0
Foth-Flex, no slow speeds, f/3.5 lens. Good condition £5 18 6

MISCELLANEOUS CAMERAS:

New Chromium Model Retina, f/3.5 Tessar, case. As new £10 17 6
Compass, latest improved model. £19 17 6
Minifex, f/1.8 Astro Pantachar. Cost £19 10s. As new £12 0 0
Nagel Rolloroy, f/2.8 Tessar, Compur. Excellent condition £10 10 0
Baldax, f/3.5 Trioplan, Compur shutter. £5 18 6
Virtus, f/4.5 Skopar. Excellent condition. £4 12 6
Vollenda, f/3.5 Radionar, Compur shutter. Good condition £5 18 6
Ihagee Parvula, f/2 Xenon, Compur shutter. Good condition £12 0 0
New Chromium Welti, parallax compensated view-finder, body release, f/3.5 Xenon, Compur shutter. As new £9 17 6

R. G. LEWIS The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780.) (Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

*"Here's your best
Xmas entertainment!"*

Choose a projector from the PAILLARD-BOLEX range

and you're sure to please everybody, because you can show more than one film size and get a **bigger choice from film libraries**. There will be a thrill for everybody—comedy, travel or real he-man drama for the adults—comics for the kiddies, and last, but not least, a big thrill for yourself when you see how good your own films look shown on a really good projector. Why be tied down to one film size, when it costs no more to have a versatile Paillard-Bolex projector and get a bigger choice of films?

The new model D.A. 37, for instance, shows both 9.5 and 16 mm. films, and for performance and sheer good value is hard to beat. It has everything you want in a home projector—very brilliant and steady pictures, on screens up to 8 ft. wide, reverse action (shows films backwards), still pictures, very efficient cooling and many other refinements, plus precision mechanism which guards against film wear. Complete with 400-watt lamp and resistance.

£29 : 17 : 6

The new 1938 range of "G" projectors incorporate many new important features without any increase in price.

TWO OR FOUR BLADE SHUTTER at the turn of a knob.

For home use the four-blade shutter gives a big reduction in flicker and enables films to be projected at *speed considerably below normal*. This refinement enables you to get 25 per cent longer showing from your films without flicker or noticeable slowing action and has a number of other advantages which there is no room to mention here.

For use in large halls, etc., where maximum brilliance is all-important, a turn of the knob changes over to the two-blade shutter, giving 50 per cent more light and clear and brilliant pictures on screens up to 16 ft. wide.

INTERCHANGEABLE CONDENSERS FOR 8-mm. FILM

This refinement is fitted to the G.3 showing 8, 9.5 and 16 mm. films and the G.816 showing 8 and 16 mm. films, and makes available the full power of the illumination for 8-mm. films. The condenser is slipped into guides and the action of changing *automatically centres the lamp*.

Specification of type "G" projectors include: All-enclosed gear drive, very powerful screen illumination, still picture device, reverse mechanism and efficient cooling, silent running and absence of film wear.

Model G.916 for 9.5 and 16 mm. films with resistance and 500-watt lamp	£45	0	0
Model G.3 for 8, 9.5 and 16 mm. films, with resistance and 500-watt lamp	£52	10	0
Model G.16 for 16-mm. films only, with resistance and 500-watt lamp	£39	0	0

paillard
BOLEX PROJECTORS

Write for details to Dept A/P.

CINEX LTD., 70 HIGH HOLBORN, LONDON, W.C.1

Illustration shows Model G.3 fitted with gear-driven arms now available to take 800-ft. reels.

All type G Projectors are guaranteed to be convertible without mechanical alteration to sound-on-film talkies by means of the Paillard soundhead, which is shortly being introduced.

Composite Greeting Cards

By "CYCLOPS."

CHRISTMAS would not be Christmas without its greeting cards, and I wanted to make my own this year.

Having read advertisements in "The A.P." for greeting cards and calendar pads on which suitable prints can be easily mounted, I searched through my stock of prints and negatives to see what I had. Of course I found the usual sort of thing which could be used, but I wanted something different, so I

(1)

hit on the plan of combining two bad prints to make one good one.

Never having made a composite picture before, this is how it was tackled.

I had by me a record print of the old Coach and Horses Inn on the Windsor road (this is still standing by the side of one of our most modern motoring roads). This print by itself was not suitable for a greeting card as it was absolutely devoid of any sort of life. But I thought if there was a real coach and horses arriving or departing from the inn this would be just the thing. Again looking through my negatives I found a coach I had deemed not worthy of a pictorial print because it was all mixed up with the background, and old-fashioned clothes rubbed shoulders with modern "lookers-on." So this is what I did.

Illustration 1 is a print of the entire negative of the old inn.

Greetings

(4)

Illustration 2 is a complete print of the coach and all its etceteras.

Illustration 3 shows the latter print with the background and unwanted details removed. This was done by placing the print on a sheet of plate glass and following the outline with a very sharp stencil-cutting knife.

Illustration 4 gives some idea of the completed greeting card. The inn has

to suitable greeting cards and calendar pads, which can be obtained quite cheaply from several advertisers in "The A.P."

To copy the composite print successfully so that the joins and edges do not show it should be evenly lighted with a front light, if daylight is used, or by two lamps of equal power, one on each side, if the copy is made at night. A slow

plate or film should be used and a little retouching may be necessary.

The foregoing may give some idea of what can be done in this direction, so that you can use old negatives from which you would never get exhibition prints. At the same time you will get an enormous amount of pleasure in making pictures to suit yourself and the occasion.

(2)

been enlarged, the coach and its retinue has been stuck on the print in such a position as to make a good composition. The front wall of the inn, the clouds and one or two other places were touched up to improve matters.

A negative was then made of the composite picture and the resultant prints were mounted on

(3)

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Amateur Cinematography

Amateur Cinematography at the Christmas Party

By D. CHARLES OTTLEY.

AT Christmas-time, and particularly at the party, the projection side of our hobby comes in for a good deal of attention. It is a natural desire to make the party presentation a hundred per cent "go" and just a little better than an ordinary film show. In the time left for preparation, although we cannot move mountains, let us see to it that all within our power is done to achieve this object, and send our friends home fired with enthusiasm for the home cinema and potential cinematographers for 1938.

Choice of a Screen.

A very important part of our equipment and indeed of the whole entertainment is the screen, and although opinion differs widely in this connection probably the best for party purposes is the plywood board coated with good quality aluminium paint. Such a screen is easily fixed, presents an almost perfect projection surface free from creases, and, above all, gives the maximum efficiency to the output in lumens of low-power projectors. Remember a picture is not judged by its size but rather by its brilliance and the peculiar stereoscopic luminosity of the silver surface gives the very best overall effect to our films. One point only should be borne in mind when using such a screen, this being to arrange seating as near to point central of the light beam as possible. This is because the silver screen is *directional*, and a falling-off of brilliance occurs to the extreme right and left of the picture area.

Raise the Projector.

Arrange to project from as high a position as possible. A small table to accommodate the projector placed upon a larger one to accommodate the projectionist is as good an arrangement as any provided the anchorage of the former table is secure. Angle projection—that is, where the projector is tilted—is not recommended since an accurately focussed picture is impossible unless the screen is also tilted. Likewise rear projection, for a number of reasons, is not recommended unless the structural characteristics of the room or rooms call for this.

The optical system should be carefully cleaned the afternoon of the show and, in cases where the projector is brought from a low temperature into a high one,

immediately before it. Lubricate carefully all working parts except the motor, using oil sparingly. Focus *before* the audience enter, and having done so refrain from touching the lens for the remainder of the evening.

Watch Motor Speed.

Speed is important in first-class projection, and it should not be forgotten that most motors tend to increase in revolutions per minute as they warm up. The screen should be watched for this and the resistance increased before action becomes accentuated. If two projectors are used (and two should be aimed at for the ideal show) the lamps and motors of each machine should be matched before the entertainment begins. It may be noticed that one gives a less brilliant "screen" than the other, in which case the lamp should be changed. A spare should always be available and also a supply of 5-ampere

fuse wire. To safeguard against exigencies is the best way to avoid them. A useful accessory on the projection table is a pocket torch, but it should only be used in cases of emergency and for lacing-up. This job should not take more than sixty seconds and, where one projector is in use, house lights should not be raised. With dual projectors the change-over is best effected by cutting direct from one machine to the other.

An Automatic Signal.

Insert between the film coils a narrow strip of white paper about three inches long. Place this from twelve to eighteen frames from the end of the reel (usually a fade-out) and watch carefully with fingers on switches for same to appear. The moment it falls from its position *watch the screen*. As the picture dims depress switches simultaneously and only the very wise ones in your audience will be conscious of the happening. Neat

Little people at Christmas-time. The street toy-sellers and their audiences offer endless possibilities for the cinematographer in search of a seasonal subject at this time of year.

change-overs are essential and a little practice will soon make perfect. The paper method is better than punching holes in other people's films, while libraries do not appreciate white paint along the edge of the band.

Selecting the filmic fare for the programme is almost certainly a matter of individual likes and dislikes, and arranging the programme is purely a matter of taste. Printing the programme is definitely a labour of love, but withal well worth while and good fun. The typewriter may be used and carbons, the duplicator, the cyclostyle or the hectograph. Spell correctly and take care that any introductory notes you may give are correct in fact and content.

Appropriate Music.

Next to good projection the choice of appropriate music should receive full attention. Whether you employ records, amplified electrically or reproduced acoustically, or our old friend the pianoforte, care should be taken in choosing the right stuff. Hackneyed tunes should be left alone and likewise work that is definitely high-brow. Between these two extremes there is available a huge repertoire of mood music suitable for anything that can fall upon the screen. In a previous article certain records were mentioned to which may be added the following seasonable items, which are at the same time cinematic in mood: Quilter's "Children's Overture," Coates' "London Suite," Brahms' "Academic Festival Overture," Humperdinck's "Hansel and Gretel" and "Miracle" music, Coleridge-Taylor's "Suite Othello," Handel's "Messiah Overture," Tchaikowsky's "The Seasons" and Squire's "The Year of the Master, Anno Domini."

Ensuring Synchronisation.

If you can manage to look after the gramophone at the same time as the projector, so much the better, for the complete unity of control in a "one-man show" makes correct fitting of music to film quite easy. But even so,

the showman must know the films by heart, so that he can make the necessary changes of record at just the right moment. For this it is desirable that he should have rehearsed the performance as a whole, music included, quite a number of times in advance of the great day itself.

Where the gramophone is operated by an assistant, every possible care should be taken to ensure that the two operators work together in perfect harmony and with complete understanding. If you, as director of the show, snap out "Next" at exactly the right instant for the change of record it is disconcerting to the audience as well as to yourself to be asked, "Do you mean the long side or the short? Or do you want the ten-inch record now?" The film will certainly not wait while these matters, which ought to have been made completely clear at rehearsals, are being thrashed out in detail.

Drill your assistant beforehand with merciless thoroughness—drill yourself too, whether you have an assistant or not—and the show will go through like clockwork, and the irritating post-mortem on "whose fault was it?" after the guests have gone home will never have to be held at all.

The Climax of the Year.

The Christmas film show should aim at a finale appropriate to the occasion. We should regard it as a grand climax not so much to the evening as to the year. If, during the summer days, we have obtained shots of our guests (or some of them) a short, personal *featurette* might be compiled suitably titled for the occasion. Pictorial and trick titles should be employed, such as a bon-bon being pulled and casting upon the screen close-ups of our friends. By means of such a film, referred to on the programme as a "surprise item," the finishing touches to a memorable evening can be given. It is the element of surprise that is the keynote to all efforts of this kind, and care should be taken to keep the secret till the last. In any

case, an appropriate title should be made wishing all our friends the season's compliments, which to the accompaniment of "Auld Lang Syne" should close the "tabs" (if there are any) or grace a colour-flooded screen (if there are not).

Library Films.

A cautionary word about films. If these are to be hired *order early* and run through the reels for faulty joins, etc. Watch also for fluff and oil at the beginnings and ends of films and wipe over with a cloth dampened with methylated spirit. A clean gate is of little use if films are dirty, and most library films *do* need attention in this connection. It may or may not be necessary to repeat once again the usual caution regarding flex extensions to the electric lighting system of the house. Keep these as short as possible and well out of reach. Run them either under the carpet or over the picture rail.

Some Final Points.

The duration of the film show proper should not exceed ninety minutes with an interval of fifteen minutes for refreshments at half-time. A generous element of comedy should liven the filmic fare and perhaps it is better to exclude pictures of a definitely dramatic character, particularly where their flavour of the sordid. The Yuletide film show is an annual affair, where the prevailing atmosphere is, or should be, light and care-free. We naturally wish our efforts to be taken seriously, but it is not a good time to tax the guest with drama of too stringent a nature. Chaplin, Harold Lloyd, pictures of fantasy and pretty sentiment, Disney, Betty Boop and Popeye are the folk to make the party show go with a swing and enthusiasm which spells success. Personal films should by all means be introduced, but not overdone, and as these are perhaps the most precious and truly cinematic contributions we have to offer the proper place for them and the place of honour is . . . the end.

Exhibitions and Competitions

CURRENT AND FUTURE.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, December 31. Rules in the issue of November 24.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Winter Snapshot Competition for users of the Purma Special Camera. £100 in cash prizes.—Particulars and entry forms from R. F. Hunter Ltd., 51, Gray's Inn Road, W.C.1.

International Photographic Exhibition in Debrecen (Hungary).—Open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

XIe International Fotosalon "Iris".—Open, January, 1938. (F. Geeraerts, Brederodestr., 22, Antwerp, Belgium.)

Preston S.S. (P.S.).—Thirteenth Annual Open Photographic Exhibition.—Entry forms, January 7; exhibits, January 14. (F. Wells, 65, Powis Road, Preston, Lancs.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Aberdeen P.A. International Exhibition of Photo-

graphic Art.—Entries, January 15, 1938; open, February 5–26. (Miss Hilda N. Bailey, 63, Watson Street, Aberdeen.)

Stockton-on-Tees and D.C.C. First Annual Salon of Photography.—Entries, January 15; open, February 7–9 inclusive. (J. Greenwell, 9, Birkley Road, Norton-on-Tees.)

Nottingham and Notts P.S. 34th Annual Exhibition.—Entries, January 21; open, February 7–12. (T. G. Earp, 14, Brushfield Street, Hyson Green, Nottingham.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21–March 12, 1938. Last day for entries, January 29, 1938. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31; open, March 7–12. (H. D. J. Cole, 11, Woodlands Road, Ilford, Essex.)

L.M.S. (London) P.S. 13th Annual Exhibition.—Entries, February 1; open, March 7–12. (Hon. Exhibition Secretary, L.M.S. (London) Photographic Society, 1, Euston Square, London, N.W.1.)

Birmingham P.S. 47th Annual Exhibition.—Entry forms, February 3; exhibits, February 5; open, February 26–March 12. (E. H. Bellamy, 20, Waterloo Street, Birmingham, 2.)

City of London and Cripplegate P.S. Thirty-third Annual Photographic Exhibition.—Entries, Monday,

February 7; open, March 7–12, 1938. (R. C. Dye, The Flats, Chesham Road, Wigginton, Tring, Herts.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23–26, 1938. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April 1938. (Hon. Exhibition Secretary, H. V. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9–April 2; entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Scottish Photographic Federation 30th Scottish National Salon.—Entries, March 2; open, April 2–16. (Percy H. Cartwright, 52, High Street, Galashiels, Scotland.)

Hackney P.S. 49th Annual Exhibition.—Entries, March 7; open, March 30–April 2, 1938. (Walter Selfe, 9, Fairlight Avenue, Woodford Green, Essex.)

Derby Railway Institute P.S. Twenty-third Annual Exhibition.—Entries, March 31; open, April 23–30. (J. Radford, Downderry, Spinney Road, Chaddesdon, Derby.)

XVIIe Salon International de Photographie de Belgique.—Entries, April 1; open, May–October, 1938. (J. Lejeune, 70, Avenue Van Becelaere, Boitsfort, Brussels, Belgium.)

Photographic Christmas Presents

FROM a roll of film at a shilling to a camera costing many pounds, there is a very wide range of choice in selecting a Christmas present, whether for a fellow-photographer or for a friend who has not yet joined the photographic ranks. Suggestions from the range of products offered by photographic firms are given on this and the three succeeding pages, but it has been impossible to include any but outstanding items. In particular, the vast range of accessories, mostly at very moderate prices, has had to be excluded from sheer lack of space, but manufacturers will in all cases be pleased to send a full list of these to any reader who cares to write for it. For addresses to which to write, please refer to the advertisement pages in this issue.

In the paragraphs which follow, an asterisk signifies that there is an illustration of the article in question.

ACTINA, LTD.

No instrument would be more useful during the Christmas festivities than a ciné projector. The Eumig Model P.III* is available in three models for

the three usual sizes of sub-standard film, and throws a large, brilliant, and flickerless picture. It uses a 250-watt lamp, and under normal conditions needs no accessory resistance. The price is £18 18s.

The same firm offers the Dollina II, which is a handy little miniature camera using 35-mm. ciné film, and fitted with a coupled range-finder. It can be had fitted with lenses of apertures from $f/2.9$ to $f/2$, in a Compur Normal or Compur Rapid shutter. The Dollina belongs to the type of miniature that can safely be carried in the pocket without bothering with a lens cap, as when it is closed the lens is completely protected by a baseboard. Prices of the Dollina II range from £12 17s. 6d. to £19 19s., according to the lens and shutter fitted.

THE ALTRINGHAM RUBBER COMPANY.

Very often it is the small accessories that make so much difference to comfort in working that the photographer never thinks of buying for himself. A set of Rubber Tripod Shoes to prevent the feet of the tripod from slipping on a smooth surface will cost only 2s., but may save the recipient a vast amount of annoyance when using a tripod indoors.

Rubber Connectors for joining a water tap to a print washer, or leading water from the tap into a developing tank, are convenient accessories that cost but a few shillings each.

A "Two-Way" Connector, enabling hot and cold water to be mixed to provide the correct temperature, is an ingenious convenience of great value in winter weather.

The Pocket Tool Scissors, combining 18 different tools in one, are adaptable to a vast number of purposes, both photographic and otherwise, and cost but 3s. 6d.

AGFA PHOTO LTD.

A splendid camera for a beginner in photography would be the Speedex

"Clack" 51, at £12s. 6d., which takes 16 pictures on $3\frac{1}{2} \times 2\frac{1}{4}$ roll film. It is fitted with an $f/8.8$ lens and a Time and Instantaneous shutter, and has built into it a yellow filter which

can be brought into position by a touch on a lever. An interesting point is that when the camera is folded the shutter cannot be released accidentally.

Those who have not yet ventured into the realms of miniature photography will be interested in the "Karat" Camera, which takes a 12-exposure length of 35-mm. film in a special charger. It is fitted with an $f/6.3$ lens with focussing adjustment in three-speed shutter, and costs £5 5s.

Several models of the "Speedex" Camera for $3\frac{1}{2} \times 2\frac{1}{4}$ pictures are made at prices from £5 5s. The "Movex 8" Ciné Camera* at £12 12s. takes a 33-ft. cassette of 8-mm. single-run film, and is fitted with a fixed-focus $f/2.8$ anastigmat. Accessories include the "Rondinax" Daylight Developing Tank at £1 13s., and a Flashlight Outfit at 14s.

THE AMATEUR CINÉ SERVICE, LTD.

Accessories of all kinds for the amateur cinematographer make very welcome Christmas presents. The "Novatype" Adhesive Letter Set for titling contains 150 ivory letters backed with a material enabling them to adhere to almost any surface, so that titles of any kind can be built up as desired. A complete set costs 25s. The "Wipacine" Titling Accessory at 20s. enables the amateur cinematographer to make wipes at any angle in real professional style, and may be used with or without a titling equipment.

Users of A.C. mains will find an "Amacine" Transformer a real economy as it does away with the wastage of power characteristic of a resistance. A model can be obtained to suit any ciné projector.

THE AUTOMATIC COIL WINDER AND ELECTRICAL EQUIPMENT CO., LTD.

Every photographer who is not already the possessor of a photo-electric exposure meter would find his work improved by the possession of one. The Avo Exposure Meter, which is equally applicable to "still" or ciné

cameras, is both compact and highly sensitive, and is made by a well-known British maker of electrical measuring instruments. A special point is that it is influenced solely by light received from the normal picture-angle, while the scales are particularly easy to adjust and read.

For colour photography the Smet-hurst High-light Exposure Meter is recommended, and many prefer it also for ciné work. With this instrument no calculations are required. The normal Avo Exposure Meter is priced at £3 3s., and the special High-light Meter at £4 4s.

BURROUGHS WELLCOME & CO.

A very suitable choice of Christmas present would be the "Wellcome" Exposure Calculator, Hand-Book and Diary.* This contains a wealth of very practical photographic information, including complete tables of development times for use with various "Tabloid" developers. The

exposure calculator is among the best known of its kind, and has been relied upon by innumerable photographers for many years past. The 1938 edition of this Diary is now available at a cost of 1s. 6d. In addition to the Diary a wide choice of Christmas presents can be made from among the developers, toners, intensifiers and reducers put up in measured quantities in the convenient "Tabloid" form.

THE CAMERA COMPANY.

Vauxhall Cameras, taking pictures either 4.5×6 cm. or $2\frac{1}{2} \times 3\frac{1}{4}$ in., are available with $f/2.9$ anastigmat lenses at prices from £5 19s. 6d., and any one of these would make a Christmas present at which any photographer would rejoice. Specialties for the cinematographer include glass-beaded screens in two sizes, the 52×40 in. costing £2 7s. 6d. For the cinematographer, 400-ft. reels for 9.5 or 16 mm. films are offered at three for 5s. 9d. or 6s. 9d. respectively, while the Humidor Cans with pads for these can be had at three for 3s. 6d.

COMPASS CAMERAS, LTD.

Those who like their photographic equipment to be compact cannot fail to be very strongly attracted to the Compass Camera,* which, in spite of being probably the smallest camera made to take 24×36 mm. pictures, contains, permanently built into it, a number of accessories, such as exposure meter, lens hood, colour filters and other such oddments that every keen photographer regards as an essential

part of his equipment. Equipped for plates in small envelopes, the Compass camera costs £30, and for an extra expenditure of £5 a roll-film back to

take six-exposure films can be obtained. In spite of its completeness, this little camera can be very comfortably accommodated in the waistcoat pocket.

THE CORONET CAMERA CO.

Of the simpler cameras, one of the handiest and most pocketable is the Vogue, which would be particularly acceptable to a beginner or to a photographer who has not yet experienced the pleasures of miniature work. Its size and weight are small, and it is made even less noticeable in the pocket by being streamlined in shape. The simple shutter has a single instantaneous speed, and the fixed-focus lens works at an aperture of $f/10$. A spool of film giving six exposures size 50×30 mm. costs only 9d., while the camera itself is priced at 15s.

CRITERION.

Every photographer who does his own dark-room work requires printing paper of one sort or another. A supply of "Bygas" paper for contact printing could not fail to be a welcome present to any user of a camera in one of the larger sizes.

A miniature photographer, and any other habitual user of an enlarger, would find a few packets of bromide paper a most welcome addition to his stock of materials, while any worker who has not yet tried the warm-tone papers would be more than pleased with the colours produced from the "Mezzotone" enlarging paper, or the slower "Vandyk" paper for contact work.

J. H. DALLMEYER, LTD.

Of all the wide range of lenses and other products manufactured by this firm, the "Sixtus" Photo-electric Exposure Meter* is probably the one that would appeal to the largest number of photographers. It is an extremely small and compact meter of sufficiently high sensitivity to give reliable readings even in a very poor light, and has the advantage that the angle of field of the photo cell is arranged to correspond with that of an average camera. This meter is priced at £5 5s. A similar meter but of larger size and lesser

sensitivity is the "Ombrux," priced at £3 7s. 6d., and of this meter there is a model for cinematographers known as the "Blendux."

For the cinematographer there is available a very large range of long-focus lenses mounted to fit almost any cine camera that will take interchangeable lenses, and a suitable choice from this range would be a splendid gift to any user of a cine camera.

As a smaller token of regard, the Dallmeier Lens-Cleaning Outfit is suitable. This costs but 3s. 6d., and enables its owner to clean a lens without the slightest danger of damaging it.

DOLLOND & AITCHISON, LTD.

Those in search of a gift sure to be appreciated and certain not to be duplicated need only purchase the Dollond Spectacle-form Theatre Glasses. These are worn like ordinary spectacles, but are instead extremely good opera glasses, so that the hands are free during the entire performance. The cost is only 45s. Dollond's Prismatic Binoculars are well known for excellence. The "Standard" 8 x 32 Wide-angle High-illumination Glass costs £7 10s., and the "Standard de Luxe" Lightweight £9 15s.

DREM PRODUCTS, LTD.

In these days of miniature cameras, when nearly every photographer is an habitual user of an enlarger, the

to be used must be stated.

M. W. DUNSCOMBE, LTD.

For home entertainment at Christmas-time there could be nothing better than an Ampro-Sound Projector for 16-mm. sound film, which gives a complete entertainment of full professional standard.

The Junior Model M is an instrument that is easy to handle in the home, and can safely be taken out for the enjoyment of a party at another house, since it operates equally well on alternating or direct current. The 500-watt lamp projects a large and brilliant picture, and the instrument is suitable for long programmes, since it will take reels of up to 1,600 ft. of film. A full reel of this size can be rewound in less than two minutes. The sound-reproducing apparatus is complete with loud-speaker, and is fitted with a volume-control and tone modulator to make it possible to obtain perfect sound reproduction under all conditions.

A gramophone pick-up can also be connected to it, as can a microphone for announcements at a party. Complete in case, this very complete outfit for home entertainment costs £127.

ENSIGN, LTD.

A suitable present for a beginner would be the Ensign E.20 Presentation Outfit, which contains an E.20 box camera and two Ensign films in a

Christmas packing at the moderate price of 10s. 6d.

For those who like to have a camera always on them there could be no better present than an Ensign "Midget,"**

the smallest camera made taking standard 3 x 4 cm. pictures. Its price is from £1 2s. to £2 15s. according to the lens and shutter fitted. For the more advanced photographer the Ensign Multiflood Outfit, which consists of stands and reflectors for Photo-flood bulbs or the photo flash-bulb outfit for Philips or Sashalite bulbs will find wide uses during the coming winter. The "Multilite" portable units, which use the long-life Nitraphot lamp, form a de luxe outfit for the photographer who does a good deal of portraiture. Other apparatus and accessories in the Ensign range include the Magnaprint enlargers at prices from £3 5s., the Excelsior Exposure Meter at £2 17s. 6d., and the new "Optiscope Sociable" at £5 15s., for home projection of standard slides.

THE FOUNTAIN PRESS.

The Fountain Press are publishers of a wide range of photographic books, and those wishing to give a book as a present to themselves, or any photographer among their friends, could not do better than apply to this firm for a copy of their catalogue. "The Photographer's Guide to Better Pictures" (5s) is a splendid book to stimulate the interest of a beginner, while "Photography and the Art of Seeing" (10s. 6d.) should be of interest to every user of a camera. "The Leica Manual" (21s.) contains an immense amount of information valuable to all miniature camera users, and there are many other books, at prices to suit all pockets, on all branches of photography.

GARNER & JONES, LTD.

The Exakta Camera, either in the original size for V.P. films or the newer Kine-Exakta* for miniature films

would be a present hailed with delight by any photographer. In both sizes the camera, which will take interchangeable lenses, is a true reflex, and is fitted with a fully-speeded focal-plane shutter. An interesting feature is that connection sockets for flashbulb work are provided. For those photographers who already own an Exakta a wide range of accessories is offered, from long-focus lenses at prices up to £30, to colour-filters at prices from 12s. 6d.

Two models of the Lumimax Enlarger are also available, while "Practos" Exposure Meters and "Stabilo" Tripods are among the other accessories suitable for gifts that are offered by this firm.

GEVAERT, LTD.

In these days almost every photographer uses films, and very many use miniature films. The Gevaert rechargeable cartridge of 35-mm. film for miniature cameras can be had, at standard prices, filled with any of four

films for ordinary work, or with a special infra-red film for experimental purposes. For those already in possession of cartridges a good Christmas present would be a multiple refill containing 3, 6, 9, or 12 lengths of film, ready trimmed for loading into the charger. The user of ordinary roll films is equally well catered for, and the Gevalux printing paper for high-quality enlargements is a material that every photographer would be glad to use.

GRANVILLE GULLIMAN & CO.

Any photographer who does his own developing and printing would be very glad to receive a Granville cheque book, which contains 21 cheques, each of 1s. in value, and costs £1. With this he could order Granville products as he required them to a total value of a guinea, without the trouble of buying postal orders to send with his letters. To the saving of 1s. must be added the saving on the poundage of the postal orders themselves. With these cheques he can buy plates, cut films, or printing papers in great variety, together with the necessary chemicals for developing, fixing and toning them.

As an alternative, a supply of Granville bromide paper for enlarging would make an excellent present, and a dozen sheets, size 20 x 16, can be obtained for 9s. 7d.

HARBUTT'S PLASTICINE

Plasticine is a material which has very many uses in connection with photography of all kinds, and is particularly valuable for making the temporary arrangements in lighting, for decoration, and even for supporting the camera, that are so frequently required during the Christmas festivities. Its use in connection with table-top photography or the photography of models of any kind is too evident to need stressing, but its application as a clean and temporary adhesive which can be used without inflicting any damage on the surfaces held together is only fully realised when use has actually been made of the material. Outfits and gift boxes containing Plasticine can be obtained from any stationers at prices from 6d. upwards.

WALLACE HEATON LTD.

Any user of a Leica camera would welcome the W.H. Iris Ring Clip*, which engages with the serrated edge of the setting ring and prevents the aperture from being altered accidentally

A model is made for each of four different lenses, and the price is 6s. 6d. in each case.

The Tray-Type Camera Case not only provides a means of carrying the camera and equipment, but provides in effect a table on which to place the various accessories and spare lenses when fitting them to the camera. Various models of this case are made to take a miniature camera with any desired selection of accessories, but a special case can be made to order to suit the needs of any purchaser.

The Metacase, which holds both a Leica and a Weston exposure meter, costs from £3, and completely solves the question of how to carry an exposure meter without inconvenience. Both camera and meter can be used without removing them from the case.

R. F. HUNTER LTD.

The new model 6 x 6 Rolleiflex at £31 5s., or the 4 x 4 Rolleiflex at £26, would be a magnificent Christmas present for any photographer, while for interesting a new-comer to the art at a considerably smaller outlay, the Purnia

Special Speed Camera* at £2 10s. would be very suitable. Possession of the latter camera, it may be noted, allows the owner to enter for a special "Winter Snapshots" competition now running.

Those who already have cameras would undoubtedly be proud to possess the Exakt Enlarger, which can be had in a number of sizes, at prices from £14 upwards.

The Tempiphot Exposure Meter at £4, with an amplifying element at £1 17s. 6d. extra for very dull light, would be of great value to any camera user, while there is a very wide range of Celfix Ciné Screens that would increase the entertainment value obtainable with almost any cine projector.

ILFORD LTD.

One of the most useful accessories for winter photography made by this firm is the "Selo" Lighting Set.* This consists of a light wrought steel stand adjustable to any position, which may be hung from the picture-rail, the mantelpiece or the back of a chair, or may be stood on the floor or table. This stand carries an aluminium reflector and a Photoflood lamp and costs, complete with universal connecting plug, 10/-.

The Ilford Dark-room Lamps are made in a number of forms, including one incorporating a clock for timing development. All the Ilford lamps take interchangeable safelights, which are made in eight types for sensitive material of all kinds. These lamps can be obtained in all prices from 21s. to 57s. 6d.

The Ilford Photo-Electric Meter is both small and highly sensitive, and a special feature of it is that in place of using Scheiner or DIN speeds a simple grouping system is adopted. Complete with leather case this meter costs £3 3s.

JOHNSON & SONS, LTD.

While Messrs. Johnson specialise primarily in the supply of various chemicals for photographic purposes, they offer also complete Home Photography Outfits, containing all the apparatus and chemicals required for developing your own films and making your own prints. These outfits, which contain everything necessary except the films and printing papers themselves, are sold at 10s. 6d., and would make a splendid gift to any who have hitherto relied on having their work done for them. For the more advanced photographer, there is the Home Printing Box at 21s., which, with the addition of dishes and a measure, converts any room

into a properly equipped dark-room for making bromide and gaslight prints under standardised conditions.

KODAK, LTD.

All the leading Kodak and Brownie models are available in the form of complete Gift Outfits, which consist of the camera and carrying-case and a spool of Kodak film, packed together in a handsome gift box. Except in the

two cheapest outfits the film included is Kodak S.S. Panchromatic film, which is the most suitable film for photography round about the shortest day of the year. The prices of these outfits run from 8s. 6d., for which a Popular Brownie, a canvas case and a spool of regular film is included, to £6 16s. 6d., which buys an outfit consisting of a 620 Kodak B, with an f/4.5 anastigmat and multi-speed shutter, a leather case and a spool of S.S. Pan. film.

Similar outfits are obtainable for the cinematographer at £10 10s. and £15 10s. Each outfit includes a Cine-Kodak Eight-20, in a black grained leather case, and a 25-ft. spool of Cine-Kodak pan. film. The lenses fitted to these two outfits have apertures of f/3.5 and f/1.9 respectively.

E. LEITZ.

The photographic activities of this firm are entirely devoted to the interests of miniature camera users, and in particular to the users of the Leica camera. While one of the several models of the Leica, or one of the many interchangeable lenses for it, would make a very handsome Christmas present, there are many similar accessories that would be very acceptable to the Leica user.

The Leitz VIII.S. Projector, projecting either miniature slides or strips of miniature transparencies on cine film, is a splendid addition to Christmas enjoyment. It costs £12 complete with 250-watt lamp and slide carrier, and is intended for use with a lens from the Leica camera.

The de luxe "Focomat" Enlarger,* which keeps the projected image automatically in focus, costs £16 6s. 6d., and, like the projector, it is intended to be used with a Leica lens.

Among accessories for the camera is the Rapid Winding Device, priced at

£3 14s. 6d., which enables successive photographs to be taken at intervals of less than a second. The "Vidom" Universal Finder, at £4 8s., is a necessity to the user of any but the standard 5-cm. lens, and any giver of a long-focus or wide-angle lens should include this accessory if the gift is to be complete.

R. G. LEWIS.

Accessories of every sort and kind for the user of the miniature camera can be obtained from this firm, including the famous Champlin 15 Developer. An exclusive line consists of Pigskin Cases for miniature cameras and their accessories. These cases, the price of which range from £2 to £10 according to the number of accessories to be accommodated, are made specially to order for each customer and take about a week to prepare.

A most convenient ever-ready case* to accommodate a Leica or Contax camera together with a Sixtus exposure meter has just been introduced, and owing to the small size of the meter this case is little larger than the standard ever-ready case for the camera alone. The case complete with meter is sold at £7 for the Leica, or £7 5s. for the Contax, or without meter at £2 5s. and £2 10s. respectively. It should be noted that when the meter is purchased at the same time as the case a reduction of 10/- is made in the cost of the latter.

MARSHALL & CO.

Those who wish to make use of their hobby as a means of providing distinctive Christmas cards for distribution to their friends should get into touch with this firm, who offer a wide range of cards, printed with suitable designs and greetings, on which the photographer's own prints can be mounted to form a really personal greeting-card. Calendars are seasonable too; and these are also available, with spaces for all the usual size of print, in styles to suit all tastes. Plain mounts and simple folders can also be had in a wide range of patterns for all purposes.

METROPOLITAN-VICKERS ELECTRICAL CO., LTD.

This firm, which is one of the largest makers of electrical equipment, has recently introduced a photo-electric exposure meter, which is priced at £3 18s. 6d. The instrument is small and compact, and very convenient to handle. It is contained in an ever-ready case, the cover of which carries a calculator disc allowing the exposure to be immediately read off for any stop and for film of any speed. There is no doubt that this instrument is one that would make a most welcome gift for any photographer.

MILLS BROS. (MODEL ENGINEERS), LTD.

For Christmas entertainment it is extremely convenient to have an episcopo in place of a lantern, so that prints or solid objects can be projected

on the screen. There are three models of the Mills Episcopo at prices from 4s. 6d. to 25s. The two larger models operate from the mains, giving pictures up to 3 ft. wide from prints of 3½ × 2½ or quarter-plate size. Accessories for these include a screen, and a correcting mirror for bringing the image the right way round on the screen.

NEWMAN & GUARDIA, LTD.

The Baby Sibyl,* which is made in two models, one for roll film and one for plates and film packs, is one of the pioneers of the miniature camera.

The pictures taken are, in either case, of standard vest-pocket size, and the instruments are fitted with first-grade f/4.5 lenses and a special shutter of high accuracy. These two cameras, which are among the most compact of their type, are beautifully made, and sell at prices from £17 10s. upwards. Any photographer receiving one of these as a present would feel that he had been given as fine an instrument as any on the market.

THE NORSE TRADING CO., LTD.

One of the difficulties of winter photography is the estimation of exposures, especially under the bad lighting conditions in which the modern ultra-fast camera is so often called upon to operate. The Rex Electric Exposure Meter* is so highly sensitive that it will give accurate readings of light intensity whenever there is light enough to take even the slowest snapshot with the fastest lens and film. Complete with case, this meter costs £5.

The miniature camera user will be interested in the Gnome Transparency Frames, which consist of a metal mount complete with mask and glasses into which a 24 × 36 mm. colour film or positive can be slipped for inspection or projection. A box of 25 of these frames is priced at 12s. 6d. In addition to these accessories a full range of Balda Cameras is available from this firm.

NURO (BIGGLESWADE), LTD.

The Nuro Films are coated on celluloid manufactured in the same factory as that in which they are sensitised. These films are obtainable in an ordinary orthochromatic emulsion, and also in a high-speed orthochromatic emulsion under the name of Superchrome. A supply of either of these will be welcomed by any photographer for his winter work, especially the Superchrome film, which by its greater speed is more suited to dull-weather conditions.

PATHÉSCOPE, LTD.

The new Pathéscope "H" Projector* for 9.5-mm. film is a high-grade instru-

ment at a moderate price, and will be found very suitable for Christmas entertainment. It is a motor-driven machine for use on alternating current of 250 volts and uses a 100-watt projection lamp as illuminant. Complete for A.C. mains the price is £10 10s., and a resistance for use on D.C. mains costs an extra 10s.

A much less pretentious instrument is the Pathéscope "Ace" Projector, also for 9.5-mm. films. This instrument is hand-cranked, and will take up to 60 ft. of film, but a super attachment for 300-ft. reels can be obtained. In spite of its low price of £1 17s. 6d. the "Ace" will throw an excellent picture up to 2 ft. wide.

PEELING & VAN NECK, LTD.

The Foth-Derby Miniature Camera and the Foth-Flex Twin-lens Reflex are both up-to-date instruments, fitted with multi-speed focal-plane shutters. Both these cameras are normally fitted with f/3.5 lenses, and the Foth-Derby*, taking 3 × 4 cm. pictures, can be bought at prices from £5 5s. upwards, while the Foth-Flex, which takes pictures 6 × 6 cm. in size, costs from £10 7s. 6d. One or other of these instruments could hardly fail to satisfy the taste of any photographer who wished to enter the ranks of miniature-camera users, while for those already in possession of the camera itself a wide range of accessories for either is available.

For indoor photography of Christmas festivities a camera stand is required. There is no photographer who would not welcome a suitable choice from the very wide range of Bulow Tripods, which can be had at prices from 8s. upwards.

PHOTO-OPTICS, LTD.

A very acceptable Christmas present would be that attractive little ultra-miniature camera the Korelle-K, which will take up to 100 pictures size 18 × 24 mm. at a single loading, while still allowing the films to be cut and developed after any desired number of exposures. Fitted with f/2.8 lens in Compur shutter this camera costs £11 11s., while for those who already have the camera an interchangeable lens for it would make an excellent gift.

Those who prefer a reflex camera will be interested in the Reflex-Korelle, a true reflex for which interchangeable lenses are available. Taking pictures 6 × 6 cm., it is fitted with a focal-plane shutter giving a wide range of speeds

and can be obtained at prices from £11 15s. upwards. Several long-focus lenses are available for this camera, including a 6-in. Cooke telephoto lens at £10 10s., while smaller accessories, including extension tubes for close-up focussing and the invaluable lens hood, can be obtained at prices from 7s. 6d.

Ultrason Colour Filters in a wide range can be obtained from 5s. 3d. upwards.

G. H. POTTS, LTD.

For the more advanced photographer a "Kalart" Speed Flash Gun would make an admirable present. This consists of a device for electrically firing flash-bulbs and synchronising them with the shutter of the camera in such a way that this can be used at any desired speed, the time of exposure being entirely included in the duration of the flash. The flash gun can be fitted to any camera to which it is possible to attach a cable release, and costs £4 12s. 6d. complete. As smaller gifts, selections from the Tetenal range of chemical products, which includes special fine-grain developers and chemicals for preventing or removing scratches on miniature films, would be very suitable.

RAPHAEL INDUSTRIES, LTD.

No photographer interested in portraiture by artificial light could fail to be interested in the "Chromora" range of lighting units. These include triple and dual units on extendable stands that can be raised to a height of as much as 6 ft. 6 in., or similar units arranged to stand on a table.

Single lamps, with reflector, on a table stand are also available for auxiliary lighting. All these units employ the "Chromora" photo-light lamp, which is an over-run bulb of life approximately three hours, and costs 2s. These bulbs are carried in small directional hand-polished reflectors, which project a very powerful beam of light upon the sitter. Prices range from £2 18s. 6d. for the triple floor stand, complete with lamps, to 12s. 6d. for the single unit. Stands and bases can also be obtained separately.

SANDS HUNTER & CO., LTD.

A roll-film reflex with f/4.5 lens for £5 5s. is offered in the Pilot 6, which takes pictures 6×6 cm. in size. It is a real reflex, in which the taking lens serves also for viewing.

The Leudi Exposure Meter at 6s. is a tiny but efficient extinction instrument for the vest pocket, and has already achieved a wide popularity.

A useful device for the dark-room is the See-Sharp Focuser* for enlarging, enabling dead-sharp focus to be obtained with certainty. It costs 13s. 6d., and would be a most welcome present for any user of a miniature camera. For the miniaturist interested in colour work, the Color-Scoper at £1 1s., a device for viewing 24×36 mm. transparencies in enlarged form without projecting them, would be a valuable adjunct to his work.

SCHERING, LTD.

Among the many photographic accessories obtainable from this firm is included the Scheroscope Focussing Magnifier for enlarging, which would be extremely acceptable to any user of a miniature camera. Its price is 17s. 6d.

Yellow Filters, and Focal Lenses for close-up work, will be of value to users of cameras of any size, and both they and the Collapsible Lens Hood illustrated are available in a number of sizes. Complete in box, the lens hoods cost 8s. 6d., while yellow filters and Focal lenses cost from 5s. upwards according to size.

Another accessory which any photo-

grapher would be glad to own is the Chromophot Luminous Exposure Meter, which costs 17s. 6d., an extinction-type meter for use by daylight or artificial light. Users of cameras fitted with a

brilliant finder would find the Voigtlander Finder Magnifier, which both shades the finder and magnifies the image four times, of considerable assistance in composing their pictures. The cost is only 4s. 9d.

R. E. SCHNEIDER.

An "M. & W." Enlarger,* of which models for all purposes are made, would be a Christmas gift that would excite the gratitude of any photographer. They are made in all sizes from 24×36 mm. to 9×12 cm. and larger, and in most sizes they are available both with and without automatic focussing.

The "Altilflex" Twin-lens Reflex, at prices from £5 12s. 6d., is an instrument in which many photographers would be interested, and it takes 12 pictures 6×6 cm. on each roll of film.

Accessories include the "Trofi" Range-finder at £1 1s., the "Arka" Flash Bulb Synchroniser, and the "Geka" Flashpowder Capsules. These last two items would be of particular interest for winter photography.

H. E. J. SPEARMAN.

One of the latest and most completely automatic miniature cameras is the Robot, which enjoys the distinction of being the only camera which advances its own film automatically. Three pressures on the release button can easily be made in a second, and with the Robot camera each of these results is a picture, the film being automatically moved on between each exposure and the next.

The camera takes up to 48 pictures 1 in. square at a single loading, and is fitted with a 3-cm. lens of an aperture of f/3.5 or f/2.8. Lenses are interchangeable, so that a telephoto lens can be fitted when required. The camera, which is very small and pocketable, is sold at prices from £23 10s.

TAYLOR, TAYLOR & HOBSON, LTD.

T.T. & H. lenses are made for all photographic purposes, and particularly for professional and amateur cinematographers. The range of lenses made for 16-mm. cameras includes an f/1.5 1-in. lens for work under difficult conditions, a 15-mm. wide-angle lens, working at f/2.5, for taking photographs in confined situations, and a large variety of telephoto lenses of focal lengths up to 6 in. This latter lens gives a magnification of six times linear or thirty-six times in area as compared with the standard 1-in. lens used on this size camera, which is in turn of narrower angle than the lens fitted to the average still camera.

THE THORNTON-PICKARD MANUFACTURING CO., LTD.

Any user of a reflex camera fitted with a standard ground-glass screen would be delighted with a present of a Stevens' Screen, which provides greatly increased and more even illumination, making focussing much easier, especially with the smaller stops. Prices are moderate. As an example, the newly introduced screen for the Rolleiflex camera can be fitted for £1 7s. 6d.

Winter being the time for enlarging, a "Perfecta" semi-automatic Vertical Enlarger* made in sizes from 24×36 mm. to 3½×2½, would find great use at this time of the year. The prices of this are from £5 7s. 6d.

J. H. TURNER, LTD.

The attention of anyone wishing to find a handsome Christmas present for a photographer might very well be caught by the British-made "Novorex" Enlarger, which is made both for 6×6 cm. and 3½×2½ negatives at prices from £8. A full review of this enlarger appeared in our issue of November 24th.

THE WESTMINSTER PHOTOGRAPHIC EXCHANGE, LTD.

The latest camera of this firm is the new model of the Westminster Victoria*, which takes 16 V.P. size pictures on a

3½×2½ spool. Equipped with an f/2.9 Cassar lens and a Compur shutter, it costs £6 15s., and it is specially to be noticed that the modern convenience of a shutter release on the body of the camera is provided.

A less ambitious Christmas present would be a delayed-action release for a Leica camera. This is completely automatic, and simply screws on the top of the release button, and costs only 15s.

The Westex "Four-Five," at £4 8s. 9d., and the Westex Junior, at £2 2s. 6d., offer exceptionally good value in 3½×2½ cameras, while the Westex miniature, at £5 12s. 6d., is a most efficient little instrument of 3×4 cm. size.

THE WESTON ELECTRICAL INSTRUMENT CO., LTD.

The Weston Photo-Electric Exposure Meters were the pioneers of this class of instrument, and may be relied upon for accurate readings under all circumstances. A number of models are made, both for cine and "still" work, and a particular feature is that the acceptance angle of each instrument is carefully adjusted to the work it has to do. Each is accompanied by the fullest possible information regarding its method of use, and this includes a comprehensive speed guide which is frequently revised and brought up-to-date.

CARL ZEISS (LONDON), LTD.

The "Sportur" Prism Binoculars, which are of the feather-weight type, would be welcomed by any recipient, whether photographer or not. They have a magnification of six times and a 24-mm. object-glass, and yet weigh only 11½ oz. The Zeiss Table Barometer at £3 3s. would be a convenience in any household. It is a really accurate instrument, adjustable to any altitude, and has a scale on which each tenth of an inch is represented by quite a wide division.

The "Turnon" Vest Pocket Telescope has a field at least three as large as that of ordinary 8-magnification glasses, and weighs about 3 oz. As an additional refinement it can be fitted with supplementary lenses to change the magnification to any figure between 4 and 20 times. The price is £6 17s. 6d.

It is hardly necessary to mention the wide range of lenses for all photographic purposes made by Carl Zeiss, among which the most suitable as a gift would perhaps be a Tele-Tessar, which would be the perfect present to any user of a reflex camera of standard type.

ZEISS IKON, LTD.

The possession of a camera by Zeiss Ikon represents the high-water mark of many a photographer's ambition

He can be satisfied at a moderate price by a selection from the Nettar* series of cameras, which take 8 or 16 pictures on a 3½×2½ spool, and are priced from £2 12s. 6d. up to £9 17s. 6d., according to equipment.

The most ambitious of the non-range-finder instruments are the Ikonta cameras, which take 8, 12, or 16 pictures on a 3½×2½ film, and cost from £7 5s. to £15 10s., according to the lens and

shutter selected. The Super Ikonta* cameras are de luxe versions of the Ikonta, embodying a coupled range-finder and many other refinements. The prices of these are from £19 5s.

The most versatile of the Zeiss Ikon range is the Contax, a miniature camera capable of undertaking work of the most diverse and difficult kinds. All models are fitted with interchangeable lenses and have coupled range-finders, and all take pictures 24×36 mm. on standard cine film. Prices range from £31 to £78 5s., for the camera with 5-cm. lens.

A very important point in connection with the Zeiss Ikon cameras is that every model fitted with a lens working at f/4.5 or faster, and some others as well, is fitted with a shutter release on the body of the camera.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, December 8th.

Aston P.S. Inter-Club Competition at Handsworth P.S.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

As an introduction to home movies for those who have not yet tasted the pleasures of the hobby, a complete "8-mm. Home Entertainment Outfit" has been devised, consisting of the "Kodascope" Eight Model 50R, a "Kodascope" Roller Screen No. 1, size 22 x 16 in., and three 50-ft. Cine "Kodagraphs" Eight. The price of the complete outfit is £15, which incidentally represents a reduction of 5s. 6d. on the prices of the items composing it sold separately. Further details of the outfit, or of the items it comprises, can be obtained on application to Messrs. Kodak Ltd., Kingsway, W.C.2.

The Camera Club Annual Members' Exhibition is now open at 17, John Street, Adelphi, W.C., and includes about one hundred selected pictures from the large number submitted. The Sir William Crawford Plate has been awarded this year to Mr. Alex. Keighley for his print "The Guardian of the Mosque." The Exhibition remains open until December 18th, and admission is free on signing the visitors' book.

Mr. Francis C. Robinson, 163, Haggerston Road, Dalston, E.8, informs us that he has had his camera, a Contax II, stolen by a confidence trick by a man posing as a clergyman. The number of the camera is B.21693, with an f/3.5 Tessar in nickel-plated mount. We issue this as a warning to our readers, who may perhaps be able to assist in tracing the stolen camera, in which case they should communicate at once with Mr. Robinson at the above address.

Photomarks offer a quick and convenient method of mounting prints in an album, and at the same time provide a concealed tab on which technical data, the names of the persons included in the picture, or the place and circumstances of its taking can be recorded. The Photomark consists of a strip of paper, gummed on both sides, which serves to affix the print to the leaf of the album, and this is threaded through a slotted strip of card which is attached to the tab. A box of 25 Photomarks, which will mount 25 photographs, costs 6d. from any dealer, or post free direct from Messrs. Blue Light Ltd., 80, Wardour Street, W.1.

We learn from the Hon. Secretary of the Bayswater and Paddington Photographic Society that an exhibition of Table-top Photography by Mr. E. Heimann, is on view at the studio of Mr. H. E. Manistre, photographic dealer, of Bayswater, who invite all amateur photographers who are interested to visit his studio to view this collection of pictures. The address is 113, Queen's Road, Bayswater, W.2. At the same time Mr. W. T. Green, Hon. Secretary of the above Society, asks us to announce that although the membership of this

Club is steadily increasing, there are still vacancies for further members, who should communicate with him at 113, Queensway, Bayswater, W.2.

Since the 1937-38 syllabus of the St. Bride Photographic Society was issued there has been an alteration in the secretaryship. The new Secretary is Miss D. M. Candlin, 3, Mecklenburgh Street, London, W.C.1, to whom in future all communications should be addressed. This season the Society has introduced a new feature into its programme in the form of monthly competitions and exhibitions, which are held on the last Tuesday in each month in the Small Hall at the Institute. Visitors are welcomed to these meetings, but at present, owing to increased membership and the limited space available for meetings, the Society regrets it is not able to extend this invitation to other meeting nights. There are still a few vacancies, and intending members should write to the Hon. Secretary at the above address.

An Exhibition of Tree Studies by Mr. Richard St. Barbe Baker, Founder of The Men of the Trees, was opened last week at the Ilford Galleries, 101, High Holborn, W.C.1, by Major-General W. P. H. Hill, C.B., C.M.G., D.S.O. The exhibition will remain open for another fortnight, from 10 a.m. to 6 p.m. daily. Saturdays, 10 a.m. to 1 p.m. Admission is free.

It is with great regret that we have to record the death of Major Trinder, Secretary of The Camera Club, who died suddenly from a heart attack early last week. We understand that the Club is anxious to fill the vacancy at an early moment and an announcement to that effect appears in an advertisement page in this issue.

The Wolverton Photographic Society inform us that there has been a change in the secretaryship of their club, and in future all communications should be addressed to Mr. S. T. Lawson, 58, Church Street, Wolverton, Bucks.

A club known as the Motor Racing Postal Portfolio has just been started with eight members, amongst whom the first folio will be circulated. The subscription is to be 5s. for the first year, after which the secretary will produce accounts and this may be adjusted. Only photographs directly relating to racing cars, racing motor cycles, racing aeroplanes and racing boats are to be entered for circulation. Full particulars may be obtained by writing to the Hon. Secretary, Mr. R. Chapman, Sungate House, Upper Swainswick, Bath.

The guinea award in this week's Wallace Heaton Indoor Portraits and Figure Studies Competition goes to Mrs. Lilian Goldring, "Timberscombe," Fernhurst, Haslemere, Surrey, for her print entitled "Harold Beeton." Full particulars regarding these weekly competitions for readers of "The A.P." appear regularly in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulae and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulae issued by the leading manufacturers of plates, films and papers.

These facts and formulae are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5 1/2 x 3 1/2 x 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

103. Makers' Formulæ: Developers for Barnet Lantern Plates—(1)

Gaslight Lantern Plates.

Metol 10 grs. (1.1 grm.)
Sodium sulphite (anhydrous) 150 grs. (17 grm.)
Hydroquinone 25 grs. (2.8 grm.)
Sodium carbonate (anhydrous) 220 grs. (25 grm.)
Potassium bromide 10 grs. (1.1 grm.)
Water to 20 oz. (1,000 c.c.)
If crystallised sulphite is used, take 300 grs. (34 grm.). If crystallised carbonate is used, take 600 grs. (68 grm.).

Dissolve in the order shown, and use undiluted at 65° Fahr. (18°C.). Development should be complete in 60 to 75 seconds.

With minimum exposure black tones are yielded, but warmer tones can be obtained by increasing the exposure.

For Barnet Gold-Tone Plates.

A. Hydroquinone 150 grs. (17 grm.)
Potassium metabisulphite 10 grs. (1.1 grm.)
Pot. bromide 50 grs. (5.7 grm.)
Water to make 20 oz. (1,000 c.c.)

B. Sodium sulphite

(anhydrous) 440 grs. (50 grm.)
Caustic soda 100 grs. (11 grm.)
Water to make 20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double quantity shown. For use, mix equal parts of A and B, and rinse well before fixing.

For Verona Warm-Tone Plates.

A. Hydroquinone 100 grs. (11 grm.)
Sodium sulphite (anhydrous) 220 grs. (25 grm.)
Water to 20 oz. (1,000 c.c.)

B. Caustic soda 30 grs. (3.4 grm.)
Pot. bromide 10 grs. (1.1 grm.)
Water to 20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double quantity shown.

For sepia tones take equal parts of A and B. Develop at 65° Fahr. (18°C.) for 4 mins.

For red tones double the exposure and reduce the development time to 3 minutes.

For very red tones increase exposure further, dilute developer to half strength and develop for 6 minutes.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Subscription Rates: United Kingdom £1 1s. 8d., Canada £1 1s. 8d., Other Countries £1 3s. 10d. per ann. post free from the publishers, Dorset House, Stamford Street, London, S.E.1. Telephone: Waterloo 3333. Telegrams: *Amaphot, Sedist, London.*

Making a Lantern Slide.

I have undertaken to make a lantern slide for use in advertising; it is to be a composite of photograph and letterpress. My idea is to mount the print and write in the lettering, photograph this with my 2½ square reflex, have the required part of the negative (it will be quite small) enlarged to the right size, and then make a negative from which to print the slide. How do I set about this, please? R. N. (Middlesex.)

Your best plan will be to make up the original, complete with photograph and lettering, so that it will fit a square space, which may be larger than 3½ in., as long as it is quite square. The larger the better in fact, within reason of course. You should then send this original to a firm making lantern slides, and ask them to make a slide from your photograph. This will probably cost you much less than trying to do it yourself, for the apparatus you have is not in the least suited to the work; you would need to equip yourself with extra accessories before you could undertake it with any real certainty of success.

Reducing Over-Dense Negatives.

Will you please give me a method for reducing over-dense negatives? I understand potassium ferricyanide is used for this; could you please give details? W. C. L. B. (London.)

For the reduction of over-dense negatives, particularly those that are flat and fogged, two solutions are required:—

- A. Hypo, about 2½ oz. (125 grm.)
Water, to make 20 oz. (1,000 c.c.)
- B. Potassium
ferricyanide 1 oz. (100 grm.)
Water to make 10 oz. (1,000 c.c.)

The working solution is prepared by adding from 25 to 60 minims of B to each ounce of A (5 to 12 c.c. B to 100 c.c. A). The addition of B to A must only be made at the moment of using, as the mixed solution deteriorates very rapidly.

Copying Line Drawing.

I have copied a line drawing on a 3½ × 2½ process plate, and have been trying to make prints the size of the original (6 × 4 in. approx.) But I cannot get the lines sharp; although the negative is perfect the lines have a slight woolly "spread" on the enlargement. What is the cause of this, and what paper and developer should I use to get as nearly as possible black lines? J. W. B. (Pewell-on-Tyne.)

If the lines on your negative are really sharp, you should have no difficulty in getting a satisfactory enlargement of such a small size as you name. We advise you to examine your negative through a magnifier; if the lines still appear sharp, the enlarger is to blame in some way. But if this closer examination shows that the negative itself is not truly sharp, your only course will be to recopy the original.

As you have to get only black and white in your print, we should advise the use of a contrasty bromide paper. Any bromide developer, such as amidol or M.Q., should give you good blacks.

Second-hand Camera from Germany

Can you tell me of a German magazine with a lot of advertisements of second-hand cameras? And if I bought a second-hand camera in Germany, should I have to pay duty on it? A. E. (Ramsgate.)

None of the German magazines which we see have more than one or two advertisements of second-hand cameras in each issue, and we should not regard it as worth your while to obtain any of them for the sake of these advertisements.

A camera purchased in Germany, whether new or second-hand, is liable to a duty of 50 per cent of its value if imported into this country. If you decide to buy a second-hand camera in Germany you should bring the receipt with you, as in the absence of proof that it was purchased second-hand you may have to pay duty on the new price.

Home-made Enlarger.

In making a home-made enlarger, I intend to clamp the camera, containing the developed but uncut film on its spools in the normal way, direct to the front of a lamphouse. I can use either of two modern fixed-extension cameras with lens focussing; both have anastigmat lenses. Is the idea practicable, please? M. V. (London.)

With the film in its normal position, the projected image will be in focus at a distance from the lens equal to that for which the focussing scale is set. As your cameras can probably not focus closer than 5 ft., you would not be able to bring the easel nearer than this and still obtain sharpness. The smallest enlargement you could make from a 3½ × 2½ negative would then be about 30 × 45 in. in size.

To avoid this limitation you will have to provide more extensive focussing arrangements; the negative will have to be held independently of the camera, allowing the latter to be moved bodily for focussing.

Copying a Design.

I want to copy an embroidery design from a book, and enlarge it on to linen cloth as a guide for working. How could I sensitise the cloth to enable me to do this? A high-quality emulsion is not needed; so long as I can get a visible image I shall be content. E. J. B. (Glasgow.)

We strongly recommend you to give up any idea of sensitising fabric for the purpose you name. It is not really a practical proposition, unless you have both the facilities and the skill of a trained chemist. You could make an enlargement on Transferotype or similar paper, and transfer it to the linen, but for your purpose we think it would be simpler to make a bromide enlargement of the size required, put this over the fabric with a sheet of carbon paper underneath, and so transfer the image on to the fabric by tracing.

Temporary Import of Cameras.

I intend to go to England shortly for a few days, and shall take my two cameras, both of foreign make. Last time I brought a camera into England I had great difficulty in avoiding payment although I showed my return ticket as proof I intended to take it out of the country again. How can I avoid recurrence of this? K. S. (Irish Free State.)

The Customs regulation concerning the import of foreign cameras into this country is that they must pay duty, the duty amounting to 50 per cent of the value of the camera. This duty, however, is not charged in cases where it can be proved that the camera will not remain in this country for more than a period of six months. In your particular case you will either have to prove to the Customs officers that you are going to take the cameras out of the country within that period, or, if you fail to convince them of this, to make a deposit of the amount of the duty and reclaim your money when you leave, producing the cameras as evidence that you are taking them out of England again.

We would add that the production of a return ticket is no proof whatever that you are going to use the return half, as you will appreciate that it would be, in many cases, much cheaper to buy a return ticket and discard the return half than to pay the duty, and we have no doubt that the Customs officers are quite aware of this fact.

NO NEED TO WORRY

any longer over the problem of the best Christmas present for your friend. Just buy him a meter, and he'll be more than pleased. It is rather difficult to decide which meter to give, however, and perhaps the following hints may help you.

In our opinion—

THE STURDIEST METER, that will give accurate results and lasting wear, is the Weston, which, either Leica or Universal model, costs

£5 19 0

THE MOST SENSITIVE METER to artificial light is, we consider, the Rex, which is also the easiest meter that we know for operation. Price, with ever-ready case£5 0 0

THE METER OF OUR CHOICE, however, is the Sixtus, which, as Uncle George might say, is seldom use anything else but. This is a very sensitive artificial light meter that also gives perfect results in daylight.

Price£5 5 0

DON'T TAKE PICTURES
During your Christmas festivities if you are not sending the films for us to process. After all, nothing but the best should be good enough for you where processing is concerned, and that, as everyone knows, means that you should entrust the work to our developing and printing service, why not write to-day for your copy of the "New Technique in Miniature Film Processing," by R. G. Lewis?

MINIATURE NEWS AND TIPS DEPARTMENT

THIS WEEK'S TIP.—If you are not quite satisfied with your blacks when enlarging, just add a tablespoonful of ordinary table salt to the paper developer and you will be surprised at the improvement in your results.

THIS WEEK'S NEWS.—We may not mention names, but a certain firm is increasing the prices of its attractive reflex camera and of its equally attractive range-finder camera as from the first of January. Another firm is producing a telephoto for its camera that will cost £93. The focal length will be 40 cm., as opposed to the 5-cm. focal length of the standard lens fitted to the camera. We think we know, though, what little Audrey might do if, knowing nothing about miniatures, someone told her that this was a miniature camera lens!

R. G. LEWIS The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780)

(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

... IT PAYS TO BUY GOOD CINÉ APPARATUS and IT PAYS EVEN MORE TO BUY it FROM A GOOD FIRM

You may deal with R. G. LEWIS (CINÉ) with confidence. The specialist policy that we have adopted is proving completely successful. Briefly, it means that we can offer better service, higher part exchange allowances and carry a larger stock of apparatus from which you may choose. Our reward is increasing business and the goodwill of every customer. We invite you to our showrooms where you can inspect our stock of projectors and cameras. There are several hundred models, including sound apparatus—Bell & Howell, Siemens, Bolex-Paillard, Ampro, DeVry, Kodak and all other good makes.

GUARANTEED SECOND-HAND CAMERAS AND PROJECTORS WITH TWO YEARS' FREE MAINTENANCE

8-mm. PROJECTORS.

Eumig P.III, 250 watts, air cooled, 25-mm. Meyer Kinon lens, motor speed control, quick-feed sprockets, geared hand rewind, for use on any voltage from 100 to 250. New condition.....	£14 10 0
Kodascope 8/35, 200-watt lamp, built-in resistance for 230 volts, 1-in. lens. New, unused.....	£8 15 0
Bell & Howell Eight, 400-watt lamp, aero cooling, built-in variable resistance, detachable gate, gear driven, with carrying-case. Perfect order.....	£32 10 0

9.5-mm. PROJECTORS.

Paillard-Bolex P.A., 400-watt lamp, reverse, rewind, still-picture device, with resistance and 40-mm. lens. Nice condition.....	£21 10 0
Specto, 3.5-amp. lamp giving terrific illumination, oil bath gear-box, powerful air cooling, 2-in. Dallmeyer Superlite lens. Very good condition.....	£12 10 0
Coronet II, sprocket driven, geared rewind, excellent illumination, built-in motor. New appearance.....	£6 17 6

16-mm. PROJECTORS.

Siemens Superlux, 375-watt lamp, ammeter, fan cooling, 5-cm. f/1.4 Astro lens, with resistance and case. As new.....	£57 10 0
Siemens Standard, 200-watt lamp, air cooled, ammeter, motor rewind, still-picture device, with resistance for 250 volts, with travelling-case. Very good condition.....	£37 10 0
Siemens Standard, Bronze Model, specially built for commercial use, specification as above, but with 250-watt lamp. Unused.....	£45 0 0

16-mm. PROJECTORS (contd.).

750-watt Ampro, air cooled, reverse, still pictures, high-speed rewind, tilting adjustment, 2-in. f/1.65 lens, with resistance and carrying-case. Very good condition.....	£37 10 0
500-watt Ampro, otherwise as above.....	£32 10 0

DUAL PROJECTORS.

Bolex G.916, for 9.5-mm. and 16-mm. films, 500-watt lamp, reverse, still pictures, separate lamp switch, with resistance. Very good condition.....	£32 10 0
Bolex D.A., for 9.5-mm. and 16-mm. films, 400-watt lamp, with resistance. Perfect condition.....	£23 10 0
Ditmar Dual, for 8-mm. and 16-mm. films, 250-watt lamp, reverse, motor rewind, still-picture device, 35-mm. lens. As new.....	£26 10 0
Siemens Sixteen-Nine, Beta film movement, 250-watt lamp, ammeter, 35-mm. Dallmeyer lens. As new.....	£47 10 0

SOUND-ON-FILM PROJECTORS.

GeBescope Model B, dual loud-speakers, 5 watts output, excellent projection illumination, complete including prism. New condition.....	£95 0 0
Amprosound Model M, triple-claw movement, 500-watt lamp, for silent or sound films, reverse, separate lamp switch, detachable, A.C./D.C. amplifier, 10-in. speaker. New condition.....	£92 10 0
Victor Animatophone, 500-watt lamp (750 lamp can be fitted), 5 watts output. A very portable outfit. Excellent condition.....	£87 10 0
Bell & Howell Filmsound Model 138, a one-case outfit with loud-speaker built into carrying-case, 750-watt lamp, quickly detachable amplifier with 5 watts output. Carefully used.....	£110 0 0

PHOTOGRAMS OF THE YEAR

THE ANNUAL REVIEW OF THE WORLD'S PICTORIAL PHOTOGRAPHIC WORK

Edited by F. J. MORTIMER, Hon. F.R.P.S. Editor of "The Amateur Photographer and Cinematographer"

"Photograms of the Year" has grown in popularity with the passing years. The volume for 1938 is the forty-third annual issue and will increase the prestige which this outstanding compilation has won throughout the world for its wide range of subjects, their technical excellence, and the quality of reproduction. It contains examples of the best work of the world's foremost camera artists, specially chosen by Mr. F. J. Mortimer, Editor of "The Amateur Photographer." Keen photographers will welcome the opportunity afforded by "Photograms" of viewing the finest and most modern expressions of photographic art, and of observing the latest technical developments.

**NOW ON
SALE**

The volume contains an editorial résumé on "The Year's Work," and contributions by well-known writers in many foreign countries. Critical notes of the photographs, and an up-to-date Directory of British Photographic Societies are also included.

Lantern Slides...

LANTERN SLIDES are a speciality of the RAINES SERVICE.

A set of slides made from your favourite negatives would provide a pleasant and interesting pastime for the long winter evenings. Send a selection of your negatives and let us make a set of slides in the most suitable colours.

RAINES ENLARGEMENTS, enhanced by attractive mounting, are ideal for home decoration, or as gifts to your friends. Now is the time to select your best negatives for enlargements; the choice of paper, also the mounting scheme, can quite safely be left to our discretion.

THE REX ELECTRIC EXPOSURE METER

The REX Electric Exposure Meter represents the highest achievement yet attained in the scientific measurement of light values for photographic purposes and is, without doubt, the most sensitive meter available. This suner sensitivity is obtained by employing a large size photo-electric selenium cell which is built into the lower portion of the meter body and thus eliminates top light and is fully protected when the instrument is not in use. Unlike other meters, therefore, it is unnecessary to shield the cell during very intense light conditions.

Consider the following points and ask for a demonstration of this amazing meter:—

- ★ Extreme light sensitivity under ANY conditions without the use of any auxiliary attachment.
- ★ The calibrated scale covers the widest possible range. From 13" to 31" Scheiner, for lens apertures from f/1.4 to f/32, and for speeds from 1/1,000th second to 30 minutes.
- ★ The photo-electric cell is protected from all overhead light.
- ★ Suitable for either still or cine work. Compact and neat, measuring only 2½ × 2½ × 1½ in.

PRICE, complete with real pigskin ever-ready case £5 : 0 : 0

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less..... 2/6
2d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6s. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to LILFFE & SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

"Gnome" Electric Negative Viewer...

for 24×36 mm. colour films or positives from miniature negatives up to 5×5 cm. The viewer is designed to take a 15-watt bulb and will accommodate either strip film or single negatives which may be conveniently and easily mounted in the "Gnome" Transparency Frames. The "Gnome" Negative Viewer gives a four-times magnification, and also an exceptionally fine stereoscopic effect to coloured films or ordinary transparencies.
Price (excluding bulb).....**£3:7:6**

"GNOME" METAL TRANSPARENT FRAMES, 5×5 cm.

A convenient and simple method of mounting 24×36 mm. colour films or positives for projection purposes and having the advantage that the film is readily interchangeable. A special mask is supplied ensuring the exact centring of the film negative. Price, 12/6 for 25, complete with glasses and masks.

THE POPULAR MINICAM FAMILY

Popular because price and performance must always appeal to the knowledgeable amateur. They're priced no less than 40 per cent lower than other cameras of similar type, and, as for performance, over a thousand enthusiastic owners will tell you that there's no situation, indoors or out, day or night, that the Vauxhall can't portray perfectly.

SPECIFICATION.

Delayed action, remote control shutter release, self-erecting rigid front, lever-operated radial focussing, hinged back, strut for time exposures, coupled range-finder with optical tubular view-finder on Deluxe model. Real leather bellows, all-metal body, finest leather (morocco) covering, 12 pictures 2 1/2 in. square or 16 2 1/2×1 1/2 in. on standard 3 1/2×2 1/4 in. film; f/2.9 anastigmat lens, Compur or Prontor D.A. shutter.

With coupled range-finder, etc., and f/2.9 anastigmat lens.....**£11:15:0**

Without range-finder, but with micrometer focussing mount, D.A. Compur shutter, unique radial focussing.....**£7:19:6**

Ditto, without radial focussing.....**£6:19:6**

Ditto, with Prontor D.A. shutter.....**£5:19:6**

Or 12 monthly payments of 20/7, 14/6, 12/3, 10/6 respectively. **SELF-FINANCED HIRE PURCHASE TERMS.**

"CIRCUS" COMPETITION

This Coupon to be affixed to back of print.

Competition closes January 25th.

IN STOCK AT ALLENS THE NEW AUTOMATIC 6 x 6 ROLLEIFLEX

HAS THE FOLLOWING FEATURES:

£31 : 5 : 0

Ever-Ready Case £1 : 17 : 6

- (1) Automatic Film Wind, which in one action automatically: (a) Sets the shutter, (b) Prevents double or blank exposures, (c) Sets the built-in self-timer for delayed action.
- (2) Loading: No red window is fitted. The film is loaded in the ordinary way, the transport handle is cranked like a cine camera until the film automatically stops at No. 1, ready for the first exposure to be made and No. 1 appears in the counter window.
- (3) Exposing: After each exposure has been made the film is wound for the next exposure—the shutter being set automatically at the same time. After the 12th exposure has been made the film automatically releases itself and the film wound off and taken out of the camera in the usual way.

NEW ROLLEICORD IA

For 12 $2\frac{1}{2}$ square pictures on $3\frac{1}{2} \times 2\frac{1}{2}$ film. Picture shown full size and right way up. Automatic film-locking device. Direct-vision finder. Large focussing magnifier which ensures critically sharp negatives.

FITTED WITH ZEISS
TRIOTAR F/4.5, £12 : 10 : 0

LATEST VOIGTLANDER BRILLIANT

New moulded body of unbreakable synthetic material. Sports finder fitted on hood. Built-in hold-all to take Focar lens or filter. Automatic film wind which prevents over-winding and ensures correct spacing.

FITTED WITH
VOIGTAR F/3.5,
COMPUR-RAPID
£9 : 0 : 0

MARTIN, Chemist, SOUTHAMPTON

Why not get a home ciné projector on easy payments spread over one or two years? Confidential, no harsh enquiries, anything taken in exchange. Wallace Heaton Ltd. or City Sale and Exchange (1929) Ltd.

BRIGHTER
PHOTOGRAPHY

By DAVID CHARLES, F.R.P.S.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. There are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing, and over one hundred and sixty illustrations, each numbered and each conveying a really useful hint.

Every keen Camera User
should be sure to get

The AMATEUR
PHOTOGRAPHER

DIARY

and Handbook for 1938

This useful little handbook contains in addition to the usual diary pages—one week to the page—over fifty pages of facts and formulae for the keen camera user. Information is given on developing, fixing baths, mountants, and finishing negatives and prints. Numerous reference tables dealing with hyperfocal distances, enlarging, screen distances for lantern projection and exposures are included, as well as sections for exposure records and personal memoranda.

Size 3½×5½ inches, well printed, neatly and strongly bound in leather cloth, with back loop pencil and round corners.

NOW ON SALE

Price 1/6 net. By Post 1/7

MINIATURE CINÉ THEATRES AT ★ ADDRESSES

HERE ARE A FEW REASONS...

and only a few of the many hundreds of reasons why it pays you to deal with Wallace Heaton Ltd. The range of Miniature cameras and accessories is unrivalled, and our experienced staff is always ready to help you with your problems.

LEITZ FOCOMAT ENLARGER

Fully automatic and employing a mixture of condensed and diffused illumination specially designed to give the best possible prints from your Leica negatives. The Model I Focomat gives automatic enlargement from two to ten diameters, and larger sizes by visual focusing. For negatives up to 3x4 cm. Takes standard 5-cm. Leica lens. Without lens

£16:6:6

24 monthly payments of 14/4.

W.H. STEEL TAPE POCKET TRIPOD

A revolution in tripod compactness. Measures only 2 1/4 x 1 1/4 in. when closed. Circular composition body houses three flexible steel legs forming a tripod 42 in. high and capable of withstanding over 20 lb. weight. Ball-and-socket head provides for easy levelling on uneven ground. Extension piece is available for horizontal or vertical pictures for cameras with only one tripod bush. Tripod, 17s. 6d. Extension piece 1s. 6d.

W.H. LEICA "METACASE"

A light-weight pigskin case (no thicker than the normal ever-ready case) which safely carries your camera with lens, Weston exposure meter and filter (or spare film). The meter is free for use as soon as the case front and single back flap are opened. Camera is secured by tripod socket screw, while remaining accessories are enclosed in separate pockets.

PRICES:

To carry Leica I, II, or III, with f/3.5 lens £3 0 0
Or with f/2 lens £3 3 0
Or f/2.5 lens and lens hood £3 12 6

'MICROLUX' (Regd.) DEVELOPING

A special process for deliberately over-exposed films. Under this process films are developed in our special paraphenylene-diamine ultra fine-grain developer—or other proprietary substances if required. This process meets the demand for the highest quality miniature film processing. All films thus developed are hardened by a special non-injurious process, and rendered almost scratch-proof, thus allowing for subsequent flawless enlargements. Literature and lists of charges sent on request.

W.H. TRAY-TYPE CAMERA CASE

Provides the answer to the old problem of where to set down the camera and accessories while changing lenses, etc. The tray case hangs round the neck in such a manner that it opens out to form a flat tray on which to place the camera in safety. The case is divided into separate compartments to take camera, exposure meter, lens hoods, filters, spools, etc. Price, in best pigskin, £5 12 6

Send a list of your own equipment and let us quote you for a case to exactly accommodate it.

9020. Zeiss Sonnar 18-cm. f/2.8 Lens, for Contax. Cost £64 2s. 6d.	£52 10 0

SIMMONS PORTABLE ENLARGER

Packs up into a case measuring 24x15x11 in. The lamphouse, small but adequately cooled, houses a 6-volt lamp and a transformer is supplied so that the instrument can be used from mains or car battery. For 4x4 or 4x3 cm. films. Has ingenious paper holder. Rotating negative carrier, detachable baseboard and synchronous timer.

£55:0:0

24 monthly payments of 49/4.

CENTERING BASE PLATE for LEICA

Fits all Leica models. It supports the camera in centre and lessens the overhang and prevents sagging. Camera can be easily and quickly removed for adjustments.

Price 10s. 6d.

W.H. ZODEL LENS HOOD

A very useful accessory for getting against-the-light pictures on winter days when the sun is at a low altitude. It also acts as a guard for the lens against rain and snow splashes. Easily fixed. Telescopic and folds flat for carrying. State diameter of lens when ordering. Amazing value. Only 7s. 6d.

'AUTOMAX' (Reg.) ENLARGEMENTS

We can supply these large-size pictures at an economical price—they cost very little more than ordinary contact prints, and are supplied in glossy or velvet surface as required. "Automax" (2 1/2 x 3 1/2) from Leica and similar size negatives and "Super Automax" (3 1/2 x 4 1/2), also "Automax Square" (3 1/2 x 3 1/2) from Rolleiflex, Ikoflex and similar size negatives. 2s. 6d. a dozen.

FREE LISTS of new Still or Ciné Apparatus, Minicams, Enlargers, Film Library, Accessories, etc. Sent for 2d. postage.

PATENTED W.H. LEICA IRIS RING CLIP

The small spring clip engages the serrated edge of the iris opening ring and secures it, wherever it may be set, against the possibility of accidental movement, while the stop can be altered if desired without hindrance.

In three sizes:

Model 5 (chromium) for Summar lens.
Model 9 (black) for 9-cm. Elmar lens.
Model 13 (black) for 13.5-cm. Elmar or Hektor lens.

6s. 6d. each.

KODAK

NEWS

NIGHT LIFE FOR SHY CAMERAS

However modest your camera, provided it has a 'Brief Time' adjustment it can take perfectly exposed pictures *indoors at night*. Baby in his bath, father at his wireless set, your friends playing cards—these are only a few of the intimate glimpses of your home life that your camera can now 'keep' for ever.

The secret is Kodak Super Sensitive Panchromatic Film and the Kodak Aids to Night Photography.

Kodak Lighting Aids consist of the Photoflood

Lamp (2/6) and the "Kodaflector" Reflector (3/-), both of which fit any standard lampholder. For 10/- you can buy a complete lighting unit consisting of lamp, reflector, stand, flex and bayonet lampholder—all ready to give you a flood of highly *actinic* light simply by plugging into any normal electric light socket. With two or three such units, faster-lens cameras can actually be used at *snapshot* speeds.

But, of course, the most important aid of all is Kodak Super Sensitive Panchromatic Film.

'HOW TO TAKE PICTURES AT NIGHT' Ask your Kodak dealer for this fascinating illustrated booklet; or write to

Mr. A. P. TAYLOR, DEPT. 57B, KODAK LIMITED · KODAK HOUSE · KINGSWAY · LONDON · W.C.2

FIRST PRIZE £25
WEEKLY PRIZE 21/-

WALLACE HEATON COMPETITION

COUPON to be affixed to each entry.
Valid until Competition closes on December 31st, 1937.

Enclosed is my entry for "....."

Competition. I agree to the rules and conditions.

Camera used.....

AMATEURS! HURRY! THERE ARE ONLY 2 MORE WEEKS

FOR
WALLACE HEATON'S

"SPEED & ACTION"

PHOTOGRAPHIC COMPETITION

Any amateur may compete, and can use any camera or materials. The scope for "Speed and Action" pictures is infinite—you can make pictures of the winter sports—ice hockey, football, steeplechasing, etc. You can take a snap of a cup in the act of smashing to smithereens on the scullery floor, or a streamline express at full speed. All efforts will be judged on their "Speed and Action" value and photographic excellence.

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. **AMATEURS ONLY** (Full name, address, title of entry and coupon on back of each entry). **ANY MAKE OF CAMERA or MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE, MOUNTED OR UNMOUNTED** (not less than 8x6 unmounted is recommended). **WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS** (if a guinea prize-winner for an extra guinea), **OR THE RIGHT OF ONE REPRODUCTION FOR 10/6.** Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.

Prizes are 21/- each week and 6 Certificates of Merit. £25 (Twenty-five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with. Acceptance of these rules, etc., is a condition of entry.

The current series of competitions ends on December 31st, all entries for "Speed and Action" Pictures are eligible for weekly prizes as well as the final £25 prize. All entries for previous subjects in the present series can now only go forward for the final judging for the £25 award.

HAVE A SHOT AT THE £25 NEW YEAR PRESENT—ENTER NOW!

Last week's prize-winner: FRITZ BORST, Schönbach, b. Eger, with picture entitled "FLY BIRD, FLY," in "Speed and Action" Competition.

Address entries to "Speed and Action" Competition,

For YOUR Xmas Gift . . .

... a real aid to better photography—a gift that gives the assurance of successful pictures—get one of these "AVO" Exposure Meters for Xmas.

The **AVO PHOTO-ELECTRIC EXPOSURE METER**

The simplest exposure meter yet produced. Tells you at a quick glance the correct aperture or shutter speed to use for the light prevailing at the actual moment of taking the photograph.

- Unique method of exposure indication. No confusing scale to decipher.
- Indicates exposures from 60 secs. to 1/2,000th of a sec.
- Influenced only by the light actually received by the camera.
- Size 2½ x 2½ x 1 in. Can be held and operated in one hand.
- Universal; for Still or Cine Cameras.

Price **63/-** Ever-ready case, as illustrated, 5s. extra.

FROM LEADING PHOTOGRAPHIC DEALERS

SMETHURST *High-Light* **EXPOSURE METER**

Designed specifically to ensure uniform image quality in Ciné work. Employs new principles, more scientific and more accurate than employed hitherto.

- Revolutionary method of exposure measurement. Readings taken on an artificial high-light embodied in meter.
- Readings ensure uniform image quality throughout every film, and perfect colour rendering in Colour Ciné Work.
- Instantaneous indication of correct aperture for perfect results.
- Enables daylight and artificial light shots to be mixed on same film.
- Ensures success in "effect" shots and effect titling.
- Simple to use. No confusing scale to read.

BRITISH MADE

Size 2½ x 2½ x 1 in. Complete with Instruction Booklet in ever-ready case fitted with carrying cord **4 gns.**

This week ... and all weeks ... at the WESTMINSTER

New PATHESCOPE Projectors

'S'—for 300 or 9.5 mm. reels

Built of high-quality die castings, ultra-smooth running motor, sprocket fed, motor rewind. High intensity low voltage lighting ensures superb brilliance of picture, with economical current consumption, whilst projection is remarkably free from flicker.

Super cooled lamphouse and separate pilot lamp provided. Gives performance of full theatre standard in your own home.

For all voltages
110/250
£30

12 monthly payments of 52/6,
24 of 26/3.

'H'—for real Home Movies'

For the projection of 30-ft., 60-ft., 200-ft. and 300-ft. reels. Solidly built. For use on all Alternating Current mains from 200 to 250 volts, 40-60 cycles. Is motor-driven through a transformer in the base. Sprocket fed, ensuring steady, correctly centred pictures, with direct and brilliant screen illumination from a 100-watt lamp; semi-automatic shutter for film projection during threading.

£10:10:0
12 monthly payments of 18/5.

—At all the **Four WESTMINSTERS**, complete, and not easily beatable stocks—and *always* the inimitable **WESTMINSTER Out-of-Income Plan.**

The NEW ROLLEIFLEX

In this new model the 6 cm. ROLLEIFLEX for 12 pictures on usual 3 1/2 x 2 1/2 spool becomes more than ever automatic, revealing a still higher standard of optical and mechanical perfection. Only one action is now needed to:—

(1) set the shutter; (2) safeguard against either blank or double exposures; (3) give delayed action. There are also amongst other improvements new controls for shutter speeds and lens apertures, with magnified reading. The reflex hood is fitted with larger magnifier and there is a double magnifier and additional mirror for eye-level use. Lens is f/3.5 Tessar, with Compur Rapid shutter speeded to 1/500th sec.

Price £31:5:0

12 monthly payments of 54/8, 24 of 27/4.

WESTMINSTER "VICTORIA"

REMARKABLE New ENLARGER. 'MULTIFAX'

Full of attractive practical features. For instance: Exceptionally smooth raising and lowering by friction gear, with triangulated main column, giving maximum rigidity. Usable either vertically or horizontally at will. Readily adaptable for dealing with enlargements of extra size.

F/4.5 lens and DOUBLE condenser are both interchangeable, and there is simple provision for correction of perspective.

Adjustable lamp-holder ensures highest degree of even illumination, whilst the unique automatic action of the strip negative carrier sets a new standard in simplicity and efficiency. Adaptable for all sizes 24 x 36 mm. to 6 x 6 cm.

PRICES:

3 1/2 x 2 1/2 **£16:16:0**

SHUTTER RELEASE

New 'MOVEX' 8-mm. Ciné Camera

An AGFA Production.

Flat in shape, notably compact, light in weight, the New "MOVEX" Ciné Camera scores powerfully in convenience of handling and ease in manipulation. With body of strong aluminium alloy, with black matt finish and bright parts chromium plated, it is both handsome and durable. Takes 33 ft. of film in any easy daylight-loading cassettes—no threading is needed. Fitted with f/2.8 Agfa Kine anastigmat, with integral adjustable hood, Newton finder, always ready for use. Exposure guide incorporated on cover of camera.

Price £12:12:0

12 monthly payments of 22/1,
24 of 11/1.

Ever-ready Case, 18/-.

Ultra-Modern Roll Film Camera, for 16 pictures 2 1/4 x 1 1/4 on normal 3 1/2 x 2 1/2 spool.

Specially strong scientific one-piece construction. Quick self-erecting front, with f/2.9 Steinheil Casar anastigmat, focusing mount. Particularly efficient optical finders. Quick and easy loading, panchromatic safety covers.

Model I, Compur Rapid shutter, 1 to 1/400th sec., T. and B., and delayed action, release on camera body **£7:19:6**
12 monthly payments of 14/-.

Model II, with Normal Compur shutter, 1 to 1/250th sec., T. and B., and delayed action, release on camera body **£6:15:0**
12 monthly payments of 11/10.

Model III, with Prontor II shutter, 1 to 1/150th, T. and B., and delayed action **£4:19:6**
9 monthly payments of 11/8.

'WESTEX Miniature'

Lowest-priced high-precision miniature. With famous f/2.9 Radionar lens, focussing to 3 ft., Prontor II V.A. shutter, 1 to 1/125th sec., T. and B. Strong, beautifully made, easy and delightful to handle, optical direct-vision finder. Takes 16 3/4 cm. on normal V.P. spool.

£5:12:6

12 monthly payments of 9/11, 24 of 5/-.

With Vidnar f/4.5 and Vario shutter to 1/100th sec. **£3:12:6**

12 monthly payments of 6/6.

New 8-mm. KODASCOPE

New WESTEX CRYSTAL Ciné Screen

Gives wonderful new brilliance to your "movies." A big improvement, but costs appreciably less.

PRICES:
36 x 27 in. **27/6** Plus 6d.
48 x 36 in. **32/6** Plus 9d.
60 x 45 in. **50/-** Plus 1/- part postage.

WHAT OTHER CAMERA CAN OFFER SUCH A RANGE OF EXCLUSIVE FEATURES FOR £12·10·0 ?

★ Full-size ground-glass screen picture, exactly as it will later appear on the film and right way up, allowing ample scope for composition. With large magnifier for fine focussing, making out-of-focus pictures impossible, and fitted with frame finder for eye-level photographing.

★ Automatic film transport, making overlapping of film impossible, and complete with automatic film counter.

★ Zeiss Triotar f/4.5 lens, and special one-lever Compur shutter speeded to 1/300th sec., T. and B.

★ Depth of focussing scale and focussing knob combined, showing at once depth of focus for all apertures and distances.

★ A complete range of accessories allowing the camera to be turned at will into a plate camera or 35-mm. miniature film camera, for use with all film materials and suitable for micro., infra-red and all other branches of photography.

★ Most economical in use, giving 12 large square pictures $2\frac{1}{4} \times 2\frac{1}{4}$ in. on a standard $3\frac{1}{4} \times 2\frac{1}{4}$ 8-exposure roll film, obtainable in every hamlet at home or abroad, and costing only 1/-.

★ Light in weight, compact size, exposure chart on back of camera; handsome appearance, with art leather covering.

PHOTOGRAMS OF THE YEAR

THE ANNUAL REVIEW OF THE WORLD'S PICTORIAL PHOTOGRAPHIC WORK
Edited by F. J. MORTIMER, Hon. F.R.P.S. Editor of "The Amateur Photographer and Cinematographer"

"Photograms of the Year" has grown in popularity with the passing years. The volume for 1938 is the forty-third annual issue and will increase the prestige which this outstanding compilation has won throughout the world for its wide range of subjects, their technical excellence, and the quality of reproduction. It contains examples of the best work of the world's foremost camera artists, specially chosen by Mr. F. J. Mortimer, Editor of "The Amateur Photographer." Keen photographers will welcome the opportunity afforded by "Photograms" of viewing the finest and most modern expressions of photographic art, and of observing the latest technical developments.

**NOW ON
SALE**

The volume contains an editorial résumé on "The Year's Work," and contributions by well-known writers in many foreign countries. Critical notes of the photographs, and an up-to-date Directory of British Photographic Societies are also included.

A NEW PROJECTOR FOR MINIATURE TRANSPARENCIES

"DIAFANT" MODEL 0

This new projector for 24×36 mm. positives from miniature negatives is an efficient, light and easily portable apparatus for use at home at the houses of friends, or at club meetings and social gatherings.

Equipped with a 100-watt lamp at 12 feet from the screen it throws a brilliantly illuminated image, measuring 4 ft. 6 in. by 3 ft. It is precision built, beautifully finished and fitted with a lens of fine quality.

£8:15:0
Lamp extra.

"DIAFANT" MODEL I

Suitable where screen pictures up to 9 ft. wide are required, also for projecting miniature colour films. This instrument is similar to the Diafant Model 0 in general design, but takes a 250-watt lamp; in view of the larger light intensity the lamphouse is more roomy and a heat-absorbing filter is used in conjunction with the condensing lens.

The slide carrier takes slides 2 in. square with a picture mask of 24×36 mm.

£12:15:0
Lamp extra.

Miniature camera advantages— with large size negatives

There are many photographers who prefer a camera giving negatives large enough from which useful size contact prints can be made, but at the same time have a keen desire for the advantages of the "miniature" camera—focussing by coupled distance meter, interlocking arrangement for prevention of double exposures, rapid Zeiss lenses, fast shutter speeds, etc. The Super Ikonta combines many "miniature" advantages with reasonably large-size negatives, and the model illustrated takes 11 pictures $2\frac{1}{4} \times 2\frac{1}{4}$ " on the usual $3\frac{1}{4} \times 2\frac{1}{4}$ " spool. It is equipped with Zeiss Tessar f/2.8 and Compur Rapid shutter to $1/400$ th second. The rotating wedge distance meter is coupled with the lens focussing; the shutter release, conveniently situated on the camera body, enables the camera to be held steadily, while the interlocking arrangement of film wind and shutter release prevents unintentional double exposures.

Other models of the Super Ikonta for $3\frac{1}{4} \times 2\frac{1}{4}$ " and $2\frac{1}{4} \times 1\frac{3}{4}$ " pictures, providing somewhat similar advantages, are also available.

SUPER IKONTA

Write for a copy of our interesting prospectus "Miniature Camera Advantages but with large-size Negatives", or ask your dealer for a demonstration.

VOL. LXXXIV. No. 2562.

THAT sound-track on the side of the cinematograph film is only at the beginning of its wonders. For better or worse it has yet to go far. Whether the world will in future bless or curse this gift from our wireless friends whereby, thanks to the thermionic valve and the photo-electric cell, sound may be photographed, remains to be seen. Col. Moore-Brabazon, in opening the recent Exhibition of Cinematography at the R.P.S. house, predicted some quite uncanny things. He suggested that with the aid of the sound-track it would be possible to obtain a synthetic voice, to reproduce the high note of a Caruso, or to pick one's way among the vocal cords, so to speak, as to endow the figure appearing on the screen with a purity and range of vocal expression far exceeding anything heard at Covent Garden. Already, Col. Moore-Brabazon pointed out, the process of synthesis has gone forward to some degree, for the most popular screen actor to-day is not a human being at all, but Mickey Mouse.

Colour Photographs on Paper.

One of the dreams of the photographic experimenter and of the scientist is the production, by direct and simple means, of colour photographs on paper. Colour transparencies, both as ciné films and stills, are now commonplace, and at that point the colour investigators appeared to have stuck, but we have recently seen a new method that gives promise of developing into a successful solution of the problem. It is the outcome of prolonged experiments by Mr. Hugh Cecil, who is well known to our readers for his portrait work, but the process, which is practically complete, is not

TOPICS of the Week

AT THE CIRCUS.

An article on Circus Photography appears elsewhere in this issue.

yet available on the market. It is an additive method of the type made familiar in the past by the Paget, Thames and Finlay screen plate colour processes, but whereas in these the result is a transparency, Mr. Cecil, by employing a fine tri-colour ruling on an opaque final support, secures the colour picture on a paper base. All that the amateur has to do is to expose a panchromatic plate in the camera in the usual manner, but in contact with a specially-ruled colour screen. From the negative so obtained, positives on film are printed, the procedure being the same as making a gaslight print. The fine lines that are embodied in the positive are then adjusted in register on the lined paper base and the colours of the subject are disclosed; the two are finally cemented together. Any number of prints can be made from the same negative. The results we have seen have been very satisfying, and we understand that a method of making the original negatives on roll film is being considered. In an early issue of "The A.P." further technical details supplied by Mr. Cecil will be published.

Posters.

A word of appreciation is more than due of "The Times" photographic posters, which add a new interest and excitement to the dreary traverse which millions of Londoners have to undertake every day through the passages of the Underground. Photography, as we all know, is the basis, acknowledged or not, of a great deal of poster art, but even when the photographic basis is evident it is so tricked or conventionalised that the photography is forgotten. But in "The Times" series we have the direct

photographs, enlarged to half poster size, and very attractive they are. Photography is used to illustrate the various services of a great newspaper, and there is one poster, with a fine landscape picture, which advertises the photographic page itself. One compares these works with other examples of poster art, and looking at them as impartially as possible, one feels that in advertising, photography has the elementary advantage of realism and directness of message. It is a mistake to have a display advertisement of any kind which he that runs cannot read. It should jump to the eye. Yet there are quite a number of mural advertisements which require some attention to discover what they are really about. That can never be said of a well-taken direct photograph. "The Times" is to be congratulated on its breakaway from poster tradition.

Threepenny and Sixpenny.

One of the brightest of the series of little lectures at the recent Exhibition of Cinematography in

Russell Square was given by Mr. Stanley W. Bowler, on lighting for sub-standard filming. Mr. Bowler is a master of improvised equipment, and at the outset he paid a tribute to "a huge American organisation which has contributed in no small measure to the success of this work." Such names as Rockefeller and Carnegie came at once to mind, but the organisation proved to be Woolworth's, whose counters Mr. Bowler has ravaged for all manner of cheap gadgets, which with a trifle cut off here or put on there make his lighting equipment just what it ought to be. For example, his spotlight is a paint-can, though with a mirror in it which Woolworth's did not provide, and for amateurs who want splashes of light for certain types of filming he produced a cheap bucket which with three lamps inside and inverted gave all that was necessary. For his lamp fittings he had made good use of little cheap dish covers and flour dredgers with which he rigged up his equipment and which made wiring easy. It rather rejoices the

heart in these days to find the true spirit of the amateur who does not depend on devices specially manufactured for his purpose, but delights to improvise and adapt as occasion demands.

Fishing Tackle.

What may be the connection between the G.P.O. Film Department and the fisheries of this country we do not know, but we have been seeing some excellent films taken under the auspices of that department illustrating various aspects of fishing. One in particular, entitled "The Herring Industry," was a very ambitious production, and suggested what a multitude of pictures this subject could yield to the still photographer. If he ventured out on the herring boats, he would be sure of pictures at every instant. Even if he did not care to go out in these cockle-shells of boats, there are plenty of scenes on the quayside when the boats are unloading and the fish being auctioned which would give him opportunity to get some striking results.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Flashlight Work.

I want to try portraits and other subjects indoors, but unfortunately have not electric current available. Do you think flashlight work worth while? If so, how can I prepare and use the powder, and what plates and developer are best? J. M. (Cheshunt.)

With the special lamps now available when current can be used, flashlight work has been almost superseded, as so much more variety in lighting can be obtained with suitable lamps properly adjusted. This form of lighting also has other advantages.

At the same time a great variety of results of first-rate quality can be obtained by flashlight methods. The "soot and whitewash" effects so often seen years ago are not inherent in the process; they were the result of improper procedure. Any tonal scheme from the strongest to the most soft and delicate can be obtained, and only a little experience is required in order to produce almost any effect desired. We would certainly advise you to adopt the process, and learn what can be done with it.

We would still more strongly advise you to abandon the idea of making flashpowder yourself; there are many reasons why it is desirable to use one of the several standard products obtainable. Even then it is necessary to adopt certain precautions, by strictly observing which you can certainly avoid the risks which arise from carelessness and ignorance in procedure.

You might try first of all the plates or films to which you are accustomed, and if you find them unsuitable you should select fast panchromatic material intended for soft results. A developer which will help you to avoid harsh contrasts is:—

A. Metol	24	grs.
Sodium sulphite	1	oz.
Potassium metabisulphite	10	grs.
Water to	5	oz.
B. Sodium carbonate	1	oz.
Water to	5	oz.

Mix in equal quantities for use.

But you will need far more guidance than we can give you within the limits of a reply. Your best plan will be to get a copy of "Flashlight for Amateurs," by J. J. Curtis, from The Fountain Press, 19, Cursitor Street, London, E.C.4 (post free 1s. 2d.). This will tell you all you need to know.

Adurol for Slides.

Can you give me an adurol formula for giving various warm tones on lantern plates? What colours are obtainable?

P. L. F. (Dartford.)

You should make up two stock solutions:—

A. Adurol	100	grs.
Sodium sulphite	2	oz.
Potassium bromide	10	grs.
Water to	10	oz.
B. Potassium carbonate	1 1/2	oz.
Water to	10	oz.

The normal solution is equal parts of each.

It is difficult to say anything about resulting colours as these cannot be definitely described in words. Further, they depend on the kind of plate used; and variations can be made by increasing exposure, diluting the solution, and using more of the B solution. Experiment is the only guide, but it is advisable to learn first all what can be done with normal procedure.

Use Your Camera AT CHRISTMAS

There are plenty of uses for the camera during the festive season as this article shows. Modern photography makes Christmas snapshotting easy, and there are other uses for photography as well.

WHILE photography is actively pursued all the year round there are plenty of opportunities for the use of the camera during the Christmas season. There are subjects for the photographer which occur at no other season, and which are well worth recording on account of the personal interest that they convey.

First it may be suggested that the photographer should be prepared by including amongst the last-minute Christmas shopping plates or films, and anything else of a photographic nature that may be required for the making of negatives and prints. It is annoying, to say the least, to find that there are subjects for the camera and the shops where supplies of films or plates may be purchased are closed for the holidays.

Subjects.

Modern cameras, fitted with rapid lenses, and highly sensitive material, provide the photographer with abundant opportunities for picture-making. It is now possible, as most amateurs know, to take pictures indoors with very short exposures. Those who have not attempted to do so will be surprised how easy it is. Out of doors there are the subjects which may be secured during a winter's morning walk, while the winter sunset also offers opportunities.

Portraits.

The Christmas season is essentially a good time for the making of home portraits. The season of family gatherings brings absent members together, and many people appreciate the opportunity of being photographed in the home. These home portraits are easy to secure with the fast plates and films now available.

Apart from portraiture there are the incidents of the festive season that are as worthy of being recorded as those of the summer holiday. The children with their toys and the groups round the dinner or card table. These are sure to be valued souvenirs of the happy time, and be appreciated long afterwards.

As we pointed out earlier in this article, the modern lens of large aperture,

even those fitted to moderately-priced cameras, will produce excellent results. Fast panchromatic plates or films reduce exposures to a second or two, while if the domestic lighting is replaced or supplemented by one or two bulbs of the "Photoflood" type, "snapshots" can be taken. If the camera is fitted, as most are, with a delayed-action release, the gathering can be complete by the inclusion of the photographer.

A Christmas Party Snapshot.

Where electricity is not available the photographer can resort to flash-powder, or in cases where this is objected to on account of smoke and smell, the flash-bulb can take its place. Actually, with fast plates or films and a rapid lens the amount of flashpowder is so small that any objection to its use vanishes. In any case, never use flashlight near to paper decorations, for obvious reasons.

Photographic Amusements.

The camera may be made to contribute its quota to the Christmas entertainment. There are various ways in which it may do so. At a

gathering of young people when they tire of games the following plan proves helpful.

A photograph is taken of the whole company. As many as possible are invited to see the plate developed, and after the photographer has desensitized the plate or film in the dark-room it is brought out into an ordinary room and developed by subdued light. Most youngsters like to see how the photographic negative develops, and especially if they are able to distinguish their own features. For this purpose it is well to use a large size negative. After the plate is fixed the party disperses to other amusements, while the photographer dries the negative (after a brief washing) in a bath of methylated spirit.

When the negative is dry the party is called together to watch the making of a few gaslight prints. A novelty is added to the party if each guest is given a print to take home as a souvenir. This is not difficult, as washing may be reduced by means of a hypo eliminator, and gaslight or bromide prints may be dried with care before a fire.

Games with Photography.

Another diversion may be made by previously photographing a series of objects in the room from "new angles." The prints are displayed, and the company invited to identify them, with a prize for the winner. This is very popular with the young people.

Several enlargements of whole-plate size may be made all from the same negative, upon cheap commercial paper. These are all cut up together, and put out in the form of a jigsaw puzzle. The subject may be a group of objects in the room, or a corner of the room in which the party is held.

Finally, a short lantern display, especially if it can be made to include scenes or incidents in which the company figure, forms an interesting and restful interlude. It should not be too long. The same may be said of the home cinema display. Some enthusiastic devotees in these fields are inclined to make their shows too long. It is wise to cease operations while there is still a taste for more.

December 15th, 1937

CIRCUS PA

By EMSLIE DEAN.

THE lure of the circus continues; the enormous crowds of youngsters and grown-ups who visit the annual spectacle at Olympia every Christmas are evidence of its popularity.

For the amateur photographer, the subject offers endless opportunities now that modern lenses and films have given him such undoubted advantages for the portrayal of the subjects available. This year, in particular, circus photography will be even more popular during Christmas-time and January, owing to the fact that hand cameras will be freely admitted and allowed to be used during performances.

At the time of writing it has already been announced that over 80,000 seats have been sold for this season's performances, and it may be assumed that a very large proportion of the visitors will also be amateur photographers and readers of "The A.P."

There are several points to be noted by the photographer who visits the circus for the purpose of trying shots at the various items. He must observe the general disposition of the lights and their quality during each turn. A lens hood will be a necessity if he is seated opposite one of the spot-lights.

Super Pan. film, 1/5th sec. at f/2.8.

The reader is referred to last week's issue of "The A.P." for seating plan of Bertram Mills' Circus and details of a special competition.

Super Pan., f/4.5, 1/2 sec. exposure.

Super Pan., 1/5th sec. at f/3.5.

On the whole the general lighting is considerable, and this is augmented during certain acts by various extra lights; this particularly applies to aerial turns, which are, in fact, illuminated almost entirely by spot-lights directed upwards. These acts are fairly easy to photograph, although with the ordinary camera the figures are likely to be small, but if sharp they can always be enlarged.

The chosen seat—for general views similar to some of those accompanying this article (which were taken at previous years' circuses)—should obviously be away from the ring-side. If, however, individual riding turns are wanted ringside seats are essential. These also are illustrated by

otography

With illustrations by Charles E. Brown and Lancelot Vining.

two of the pictures herewith. The photographer should not move about once his seat has been settled, as this is not fair to other members of the audience.

It should be realised that if quickly-moving subjects are attempted a camera with a large-aperture lens and loaded with the highest speed films available must be used. Should these not be available there are still many other shots possible, where comparatively long exposures may be given, and using a much smaller aperture to the lens. Some of these are indicated in the data given with the accompanying illustra-

Super Pan. film, 1/10th sec. at f/3.5.

With luck in the choice of a good seat some remarkably fine pictures should be secured. So long as the fastest possible pan. films or plates are used, the owner of any hand camera, provided his lens aperture is not less than f/6.3, has a chance of getting some passable results. The big-aperture lens is, however, necessary for "speed" shots.

As the subject will probably appeal sufficiently to attract the amateur who is seeking good results it is advisable to visit the show twice, so as to try out the subjects with experimental shots, and to decide on the most advantageous position from which to photograph on future occasions

Group of horses coming towards camera, not too quickly. Super Pan. film, 1/25th sec. at f/2. Considerably enlarged.

tions. It will soon be realised, however, that there are many shots that are possible with exposures ranging up to as long as one or two seconds, where there is a cessation of movement, and fully exposed results can be obtained with an ordinary camera. It will be necessary to hold the camera very firm and steady, and a direct-vision view-finder at eye-level is essential.

It will be seen that for the miniature worker, however, the opportunity is one that should not be missed. Here are ideal subjects for testing the capabilities of the high-class miniature with large-aperture lens and ultra-speed film.

Super Pan. film, 1/100th sec. at f/1.5.

Readers' Hints, Tips and Gadgets

GENERAL LIGHTING WITH PHOTOFLOODS.

WHEN using Photoflood bulbs for indoor photography it is often difficult to fix the bulb, with a large reflector attached, safely at a good height. To get over this difficulty, I have made the gadget illustrated, which has solved all my difficulties in this direction. It is small, light and portable, yet is absolutely rigid, and fixes to the picture moulding, deflecting the light in any desired direction.

The illustration should make its construction clear; no exact dimensions are given as they are unimportant. It consists essentially of a T-piece of 1-in. square wood having a picture-hook fixed by screws near each end of the top-bar and an adjustable strut to brace against the wall. Two further short pieces are attached by means of bolts with wing-nuts so as to allow

movement of the lamp both vertically and from side to side. At the end of the second of these is a small batten to which the lamp-holder is

screwed and which has a small hole drilled in it for the passage of the flex.

The picture-hooks are fixed on the moulding in the usual way, the strut adjusted so that the bar slopes very

slightly downwards, and the whole is then quite rigid. It is surprising how great a weight it will bear when firmly fixed. (Incidentally, a small piece of rubber tacked to the end of the strut avoids any danger of making a dent in the wallpaper.) If a light is required at a low level, just turn the whole through 90 degrees and it stands equally firmly on the floor.

The whole thing may be taken to pieces by withdrawing the bolts and reassembled very quickly. Notice that the T-piece is made in two separate pieces; if portability is not required this may be all one piece, and the strut could be permanently screwed on at the correct angle. The dimensions may be varied as desired, but the shorter the last two pieces the firmer the whole will be when a heavy reflector is used. L. H. SUGDEN.

FOCUSsing MAGNIFIERS.

THERE must be a great number of readers who are still faithful to the older types of reflex cameras, which are not fitted with focussing magnifiers.

To them this little idea is commended. Roughly measure the distance from the surface of the focussing screen to the eye position when using the camera. From the optical counter of the local "universal provider" (F. W. Woolworth and Co.) carefully select a pair of horn-rimmed spectacles in the following manner:—

Place the eyesight testing card, which you will find on the counter, in such a position that your eyes are approximately at the measured distance from it. Take up a pair of spectacles and place them about 2 in. from your eyes. If the

letters on the chart are sharply focussed you have got the right pair; but don't be in a hurry, try a few pairs to determine which you like best. Pay your 6d., and from the local electrician purchase two surface wiring clips similar to sketch B.

Now to business. Cut the spectacles in half with a pair of snips or a sharp penknife. Cut down the hinged ear-pieces to within $\frac{1}{4}$ in. from the hinge. Secure one of the wiring clips to the $\frac{3}{4}$ -in. piece, and then bend it in such a manner that it will clip over the focussing hood and the lens will rest horizontally over the focussing screen at a distance from your eye equal to that at which you tested it.

Follow out the same procedure with the other lens and clip. The result—two properly corrected focussing magnifiers. T. R. MONKHOUSE.

A QUICK-LOADING FRAME FOR GASLIGHT PRINTS.

THE ordinary type of printing frame is really designed for daylight printing; for making gaslight prints I have found it much quicker and easier to work with a simple home-made frame.

For this you need a piece of glass (cleaned-off plate), a mask, a rubber band, a piece of 3-mm. plywood, same size as glass, and a tube of glue, of the sort advertised to stick anything. The glass should be of the same size as the printing paper, and the mask is glued to the underside of it. The end of the glass is fixed to the end of the plywood

with a rubber band, glued on. The band should be strong enough to keep the parts tight together, but not wide enough to interfere with the action of the mask.

To use the frame, insert the negative and paper, working in your own shadow, and grip the sides of the glass with thumb and second finger, using the knuckle of the first finger to press the plywood back hard up against the back of the printing paper. Turn round and expose the paper to the lamp and then back again into your shadow to remove it. P. W. BLANDFORD.

A CONDENSER ENLARGER TIP.

WITH a thin negative and brilliant illuminant, the time taken to expose a bromide print with a large-aperture lens enlarger becomes so short that difficulty is often experienced. Apart from the possibility of shaking the apparatus and blurring the image, an exposure of one second allows of no error, but one of ten seconds is convenient and safe. The best way to accomplish this is to stop the lens down, or, alternatively, use a less powerful light. When the lens is stopped down, however, it is often difficult to obtain even

illumination over the whole picture area. In my own case I found this to be due to the trade mark stamped on the dome of the electric bulb being brought into partial focus. A search through an electrician's stock showed that all his brands of lamp were thus stamped, whereas if the trade mark had been on the side, this difficulty would have been obviated. However, I found that a rag moistened in petrol and rubbed, with the finger, over the trade mark or other lettering was sufficient to remove it entirely, leaving a clear pearl bulb without damaging it in any way. A. T. BAILEY.

PEARLS AND PIGLETS

Maybe we're being unkind to some people we saw recently on Loch Tay; perhaps they were not porcine, but the Rolleiflexes they were using certainly were pearls that they did not deserve. A youngster on the same boat, busy transferring Ben Lawers on to the Agfa F in his 520 Ikonta, soon restored our faith in travelling miniaturists, but we cannot forget the look we saw directed by a quarter-plate-ist towards those snapshotting dilettanti.

A day or two later, sitting on a little concrete ordnance mark on top of Ben Lomond, and idly wondering whether Scotland were real or just a wonderful dream, we were surprised to see the quarter-plate man come round the corner on to the flat summit. He was cold, but his righteous indignation when he spoke about our fellow passengers on the loch effectively warmed him, and we were soon talking photography. He admired our Contax, and told us that he hoped to get a 531 Super Ikonta as soon as R. G. Lewis ("you know them, of course," he said) had another in their weekly second-hand list.

A SENSITIVE NATURE

and broad humour do not mix over well, and it has often struck us that some sensitive miniaturists might possibly shrink from the idea of hire purchase as a consequence of quips that are occasionally heard about it.

To any such we say "Come to '202'." All your groundless fears will be dispelled, and you will be able to use the better equipment you need for a quite low monthly outlay.

A GUARANTEE,

when issued by a firm that prides itself on its straightforward and honourable dealing, gives a feeling of security to the purchaser that it would be difficult to put into words. All miniature apparatus sold by us is guaranteed against any defect whatever for one year from the date of purchase, and indefinitely after expiration of that period against any inherent defect. So, when buying your next camera, why not "Buy 'Lewis' and Buy Safe!"

LEICAS:

Leica III, f/1.5 Plasmal, coupled. Excellent condition £37 17 6
Leica III, chromium, fitted f/1.55-cm. Plasmal (coupled) E.R. case. As new. Cost over £50. £37 10 0
Leica III, chromium, f/2 Summar, E.R. case. As new £32 10 0
Leica III, black, f/2 Summar, E.R. case. As new £31 10 0
Leica II, chromium, f/3.5 Elmar. Indistinguishable from new. £22 15 0
Leica II, black, f/3.5 Elmar, E.R. case. Practically as new. £19 10 0
7.3-cm. f/1.9 Hektor Lens, latest rectilinear focussing. As new £19 17 6
Another, as above, but non-rectilinear. Excellent condition £17 17 6
4-cm. f/1.5 Meyer Plasmal, for Leica. As new £10 17 6
5-cm. f/2 Summar. As new, nickel. £13 10 0
Leitz Varyl Enlarger, for negatives up to 6×6 cm., with lens. Good condition £14 15 0
15-cm. f/2.3 Astro, for the Leica, reflex attachment. Cost £95. As new. £55 0 0

CONTAXES:

Contax I, slow-speeds model, fitted new-type collapsible f/2 Sonnar. As new £29 15 0
8.5-cm. f/4 Triotar for the Contax, any model. As new £11 15 0
4-cm. f/2 Biotar for Contax. As new £12 10 0
Contax III, f/1.5 Sonnar, case. As new £65 0 0
Another, as above, but with f/2 Sonnar and case £52 10 0
Contax II, fitted f/2 Sonnar, E.R. case. As new £39 10 0
Large Reproduction Apparatus for Contax 1454/28, complete with three lenses 995/32. As new £11 15 0

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS:

531 Super Ikonta, f/3.5 Tessar and Rapid Compur, E.R. case. As new £16 17 6

Dollina II, f/2 Xenar, Rapid Compur. As new £15 15 0
Dollina III, f/2.8 Xenon, Compur. As new £13 17 6
Ensign Autorange, f/3.8 Tessar, Rapid Compur. As new £15 15 0
Super Ikonta 531/2, f/3.8 Tessar, Rapid Compur, Albada finder, etc. As new £19 10 0
Super Ikonta 530/16, f/3.5 Tessar. As new £18 17 6

We breathed a sigh of relief when we heard his remark, for we had feared his judging miniaturists and miniaturism by those miniature camera users he had seen. Fortunately, there are, so far as we know, very few who abuse the art of photography among those who habitually "Try 202 for Service."

THE MINIATURE NEWS AND TIPS DEPARTMENT

THIS WEEK'S TIP (for which we thank Mr. C. S. Brown, of 161, Princes Avenue, London, N.13). You may need one day to reduce a film that has been treated with Teitel's Scratchproof solution. To do so, give the film a two-minute bath in 1 per cent sulphuric or hydrochloric acid, and then, without washing the film, proceed to the persulphate reducing bath. After reduction and the use of a stop bath, wash thoroughly and re-treat with Teitel's.

THIS WEEK'S NEWS.—Overcoming our customary shyness we were gaily shaking a light fantastic toe at a recent Agfa dance when a voice whispered in our ear that it was confidently expecting early delivery now of the new 35-mm. Agfa Rondinax tank—and what a tank it sounds. We've only hearsay to go on at the moment, but the idea of a daylight tank that will successfully engulf 12, 24 or 36 exposures from the standard roll fascinates us, as also does the idea of a built-in thermometer. The same voice also whispered that the price would be £3 10s., which strikes us as being very reasonable if the tank turns out to be even only half as good as it sounds.

STOP PRESS.—Champlin 15 users should take note of our Mr. G. A. Bailey's tip given to "Minicam" (see page 35 current M.C.M.)

DON'T MISS

Our advertisement on page 11 of the current "A.P." issue—there is quite possibly something there that will interest you if you are looking for a new camera at a low price.

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS—contd.:

Weltini, latest chromium model, combined view and range finders, body release, f/2 Xenon. As new £20 5 0
Another, as above, but fitted f/2.8 Tessar. As new £18 17 6
Another, as above, but fitted f/2.8 Xenar. As new £16 17 6

R. G. LEWIS The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780.) (Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

GUARANTEED USED CINÉ CAMERAS AND PROJECTORS

You may deal with R. G. LEWIS (CINÉ) with confidence. The specialist policy that we have adopted is proving completely successful. Briefly, it means that we can offer better service, higher part exchange allowances and carry a larger stock of apparatus from which you may choose. Our reward is increasing business and the goodwill of every customer. We invite you to our showrooms where you can inspect our stock of projectors and cameras. There are several hundred models, including sound apparatus—Bell & Howell, Siemens, Paillard-Bolex, Ampro, De Vry, Kodak and all other good makes.

GUARANTEED SECOND-HAND CAMERAS AND PROJECTORS WITH TWO YEARS' FREE MAINTENANCE

8-mm. PROJECTORS.

Eumig F.III, 250 watts, air cooled, 25-mm. Meyer Kinon lens, motor speed control, quick-feed sprockets, geared hand rewind, for use on any voltage from 100 to 250. New condition£14 10 0
Bell & Howell Eight, 400-watt lamp, aero cooling, built-in variable resistance, detachable gate, gear driven, with carrying-case. Perfect order.....£32 10 0

9.5-mm. PROJECTORS.

Paillard-Bolex P.A., 400-watt lamp, reverse, rewind, still-picture device, with resistance and 40-mm. lens. Nice condition£21 10 0
Specto, 3.5-amp. lamp giving terrific illumination, oil bath gear-box, powerful air cooling, 2-in. Dallmeyer Superlite lens. Very good condition.....£12 10 0
Coronet II, sprocket driven, geared rewind, excellent illumination, built-in motor. New appearance£6 17 6

16-mm. PROJECTORS.

Siemens Superlux, 375-watt lamp, ammeter, fan cooling, 5-cm. f/1.4 Astro lens, with resistance and case. As new.....£57 10 0
750-watt Ampro, air cooled, reverse, still pictures, high-speed rewind, tilting adjustment, 2-in. f/1.65 lens, with resistance and carrying-case. Very good condition£37 10 0
500-watt Ampro, otherwise as above.....£32 10 0

16-mm. PROJECTORS (contd.).

Siemens Standard, 200-watt lamp, air cooled, ammeter, motor rewind, still-picture device, with resistance for 250 volts, with travelling-case. Very good condition£37 10 0

DUAL PROJECTORS.

Bolex G.916, for 9.5-mm. and 16-mm. films, 500-watt lamp, reverse, still pictures, separate lamp switch, with resistance. Very good condition.....£31 10 0
Bolex D.A., for 9.5-mm. and 16-mm. films, 400-watt lamp, with resistance. Perfect condition.....£23 10 0
Ditmar Dual, for 8-mm. and 16-mm. films, 250-watt lamp, reverse, motor rewind, still-picture device, 35-mm. lens. As new.....£26 10 0
Siemens Sixteen-Nine, Beta film movement, 250-watt lamp, ammeter, 35-mm. Dallmeyer lens. As new.....£47 10 0

SOUND-ON-FILM PROJECTORS.

GeBescope Model B, dual loud-speakers, 5 watts output, excellent projection illumination, complete including prism. New condition.....£95 0 0
Amprosound Model M, triple-claw movement, 500-watt lamp, for silent or sound films, reverse, separate lamp switch, detachable, A.C./D.C. amplifier, 10-in. speaker. New condition£92 10 0
Victor Animatophone, 500-watt lamp (750 lamp can be fitted), 5 watts output. A very portable outfit. Excellent condition.....£87 10 0
Bell & Howell Filmosound Model 138, a one-case outfit with loud-speaker built into carrying-case, 750-watt lamp, quickly detachable amplifier with 5 watts output. Carefully used£110 0 0

Adjustable Roll Film DEVELOPING TANK

NEW!

A Roll
Film
Develop-
ing Tank
for Films
of all
Popular
Sizes

PRICE

£1 10 0

From all Dealers.

- Fully adjustable to films of all sizes from a full 3C-exposure roll of 35-mm. (Leica size) to 2 1/2 x 4 1/4 in.
- Made entirely of genuine bakelite.
- No corrosive parts to affect or be affected by chemicals used in developing or fixing.
- Films are loaded quickly and easily, no apron required.
- A spiral groove holds the film securely in place.
- No superfluous gadgets to impede its swift and efficient operation.

SANDS HUNTER & CO. LTD.
37, BEDFORD ST., STRAND, W.C.2

Be sure to have a carton of Johnson's FLASHPOWDER for your Christmas snaps

NO SPECIAL APPARATUS NECESSARY.
NO PREVIOUS EXPERIENCE REQUIRED.

1/- carton contains
sufficient powder for
8 or 10 exposures,
also full directions.

Obtainable of all dealers.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

PHOTOGRAPHY

By JAMES
JARCHÉ.

without Tears

A FRIEND of mine lent me a camera, and he said "Be a sport and tell me what you think of it." I was in rather a hurry and did not ask him very much about it—all he said was "You will find all the dope inside." When I got back to my office I opened the parcel and found it was a 50s. Purma miniature camera, and inside the box there was also a portrait attachment. I did not think much of it at the time—I suppose the price put me off—but somehow when I handled the camera I felt there was something in it. It felt nice to hold, and the more I toyed about with it the more fascinated I became. In fact, when I had finished reading the instructions, there was so little to do that I thought it was impossible, and, as I had to cover a Rugby match for my paper the following day, I took it along with me just for devilment.

One-Hand Shots.

The match happened to be Barts v. Richmond at Chislehurst, and after shooting all the pictures I wanted for my paper with my usual miniature, I just slung it round the opposite side of my body and brought the Purma to the front. I shot away with it for the last ten minutes before the game finished—honestly, it felt all too easy. No focusing to do, no apertures to worry about, in fact, one or two shots I took with one hand. After the match I packed the camera up, went to my office and slung it into a drawer and carried on with my real job. About four days afterwards I thought I would develop the film of the pictures I had taken with the Purma, and to my amazement, and without any exaggeration I found that I had obtained better action pictures which, had I developed them on the same day, I am sure would have been used for the paper as well as the ones I had taken with my own camera.

The following day I was motoring through Richmond Park and I noticed a deer in the roadway, so I pulled up the car, and to my amazement the deer

Taken with Purma camera at 1/150th sec. on Agfa F film. Good light.

BARTS v. RICHMOND, AT CHISLEHURST.

made towards me and came quite close. I had a piece of cake—which, I might add, was a portion of my lunch—and handed it to the animal, and we became very good pals. I whipped out the Purma, slipped on the portrait attachment and slowly walked up to the deer's head until he filled the size of the finder, and gave an exposure of 1/150th part of a second. As the illustration shows, the picture is perfectly sharp and would enlarge up to six feet without grain.

Now I think this little experiment of mine is one of the biggest surprises I have had in my photographic career—it is really "Photography without Tears." For people who do not want

to worry about gadgets, expense, etc., this little camera is the very thing. I can assure you they will have great fun, and will get results into the bargain.

Some Technical Details.

The aperture of the lens is f/6.3, and the focal length is $2\frac{1}{4}$ in. The film I used was Agfa Isopan F, and I developed this in Kodak D76, giving a seven minutes' development at the usual temperature of 65° Fahr.

I forgot to add that the shutter is of the focal-plane type, and has 3 speeds. Holding the camera horizontal gives 1/150th sec., turning it in the vertical position to the right is 1/25th, and again turning it to the left vertically, is 1/450th part of a second. I take my hat off to the people who are responsible for this neat little camera, and to all those who just want results with simplicity I would say "Try it, and here's to good shooting!"

BARTS v. RICHMOND. This and the picture above taken with Purma camera at 1/150th sec. on Agfa F film, at 3.45 p.m.

How I "shot" The King

By D. OSMOND.

an inspection of prize cattle I found I'd fired twenty-five exposures, an impossibility with old methods, but easy with the modern instrument.

Depth of Focus.

One advantage was particularly impressive. When His Majesty left the farm, some time later, he had a walk of about seven yards to his car, and during his walk I was able to get two shots without altering focus. Both are reproduced, and their difference in focus is not noticeable, even though taken at f/3.5.

In passing I might say that one of these was reproduced on a newspaper contents bill, a half-tone block about fifteen inches wide, and I can assure you that no one would detect that it is an enlargement of "more than somewhat."

There is little to say about processing: Metol-Meritol to Johnson's formula and temperature was used, and after a minimum wash the film was dried in a fairly hot drying cupboard. Rather brutal treatment, but time and a newspaper office demand it, and the results seem to suffer little in consequence. In future when assigned to similar functions I feel sure my luggage will be minus one 9x12 camera and anything up to 2 dozen single metal slides. Nor am I alone in this decision, for I observed in a recent film of the Shanghai fighting that the three pressmen who appeared in the film were all equipped with miniatures.

Taken, without re-adjustment of focus, a few seconds after the photograph reproduced below, this has made a poster-picture 15 inches wide.

IT is well said that confirmed habits need strong measures to break, and as an adherent for many years of the 9x12 press type of instrument it has taken me some time to fall for the many virtues of the modern miniature.

For many things I still prefer the 9x12, but there is no question that the miniature scores heavily in portability and quickness of operation, and it is unobtrusive. Furthermore, when the results are reproduced in the coarse half-tone required for newspaper production it is indistinguishable from the result from a larger negative.

I was assigned to cover the King's recent visit to his farm at Stoke Climsland, Cornwall, and

up to the Leica, for the largest aperture among the 9x12's was only f/3.5.

Just as the King arrived the weather decided to be kind, so I set to f/4.5 and 1/100th sec., and with Agfa I.S.S. film produced an excellent batch of negatives. Don't ask what the light meter said,

Comparison of this with the larger picture above shows that although there was no time to re-focus the characteristic depth of the miniature has allowed both to be sharp. F/3.5, 1/60th sec.

for, I still don't carry one; but no doubt I shall go all modern in time.

As His Majesty was receiving some 200 of his tenants it gave plenty of opportunities, but de-

His Majesty meets his tenants. F/4.5, 1/100th sec., I.S.S.

it was suggested that a Leica would be less conspicuous for such an occasion. Hitherto, I have only used a Leica when compelled by circumstances, so that my feelings were somewhat mixed when divorced from the old 9x12 and allied to this new love of miniature proportions.

Arrived at the King's farm I found the usual gathering of pressmen from Fleet Street and the local press, all equipped with 9x12 outfits. We all anticipated a soaking, for the weather had been atrocious, and with the light that accompanies such conditions in December, and the hour 2 p.m., it looked rather like f/2 work. This would be one

The King inspects his prize cattle. F/4.5, 1/100th sec., I.S.S.

spite the opportunities it was a joy to be able to give a quick wind to the shutter and have the next film ready for exposure. With a larger camera I've missed many a picture with a sticking sheath or an awkward slide. After the reception and

Here the King has just planted a tree in memory of his visit. F/2, 1/40th sec., I.S.S.

Modern Miniature Enlargers

THE MAGNAPRINT MODEL V/O.

THIS particular model of the Magnaprint series of enlargers is the smallest and most inexpensive of those for negatives of size up to 3×4 cm. It is of the modern vertical pattern, and is, of course, focussed by hand.

Baseboard, upright, and projector-head are separated for ease in packing, so that the first task on receiving it from the makers is to re-assemble the enlarger, for which purpose no tools other than a spanner and a small screwdriver are required. To the baseboard, consisting of a strongly-made frame covered with stout plywood and painted black, the upright is attached by three strong bolts. This done, the arm carrying the projector-head is slipped on to the upright on which it is held at any desired height by a firm clamp operated by a lever.

The condenser, which consists of two lenses, is sent unmounted; a plate just above the slot for the negative carrier is removed by undoing two screws, and the two lenses are slipped, convex sides facing, into metal clips that automatically position and centre the lenses with sufficient accuracy. This simple but effective condenser-mounting is doubtless one of the simplifications in design that enable the price of the instrument to be kept low, and performance certainly does not suffer from lack of a more elaborate mount.

The negative-carrier consists of a shallow wooden tray into which fit two glasses, between which the film is held. A series of masks, one for 24×36 mm. and two for 3×4 cm., are included, one of the 3×4 cm. masks being intended for cameras such as the "Double-8," which makes the usual 16 exposures on a V.P. spool, and the other for the Ensign "Midget," which yields films in which the negatives lie lengthwise along the strip of film instead of across it. A plate of spring metal laid on the carrier holds the two glasses together when the carrier is inserted in the enlarger, and the ends of the glass plates are bevelled to prevent the film from becoming scratched when drawn through the carrier. The design is such that single negatives or complete strips can equally well be used.

Focussing is carried out by a helical mount which gives the lens, an f/6.3 Ensar anastigmat, a wide range of movement. At the greatest extension an enlargement of as little as 2.2 diameters is obtained, corresponding to a picture $3\frac{1}{2} \times 2\frac{1}{16}$ inch from a full 24×36 mm. negative, or $3\frac{1}{2} \times 2\frac{1}{8}$ from a full 3×4 cm. negative. At the other end of the range, with the projector head at the top of the upright, the enlargement yielded is nearly $9\frac{1}{2}$ diameters, which gives a print $13\frac{1}{2} \times 9$ in. from a 24×36 mm. negative, or $15 \times 11\frac{1}{2}$ in. from the 3×4 cm. size. As with most manually-focussed enlargers, the head can be turned round on the upright so as to project a picture past the baseboard on to paper held at some lower level; by this means enlargement to an unlimited degree is possible.

The baseboard, which will accommodate paper up to 15×12 in., is fitted with a card ruled with all standard sizes from 15×12 to $3\frac{1}{2} \times 2\frac{1}{8}$, and carries spring metal bars to hold the paper flat during exposure. An orange cap allowing the image to be adjusted into place on the bromide paper itself is supplied. The illuminant used is a 100-watt opal lamp, which gives a brilliant and evenly illuminated field.

The Magnaprint masking squares, used in conjunction with the paper-holding bars, form an effective mask, enabling prints to be made with the popular white margin. These squares, which are graduated in inches, are kept parallel with the sides of the baseboard by a guide running along its front edge, and form a very worth-while accessory to the enlarger. Their cost is 7s. 6d. per pair.

Complete with f/6.3 Ensar anastigmat, but without lamp, this model of the Magnaprint enlarger sells at £5 5s. It can be obtained from any dealer, or direct from Messrs. Ensign Ltd., Ensign House, High Holborn, W.C.1, to whom application should be made for further details of this or any other enlarger of the extensive Magnaprint range.

Miniature Camera Gossip

By LANCELOT VINING.

AS I expected, my visit to the Philips' lamp factory proved intensely interesting; my chief concern was with the manufacture of the Photoflux, and I watched every stage of this for more than two hours, often using a powerful magnifying glass.

Then I had a long interview with their Mr. Manders, the technical expert in charge of manufacture. He would not agree that any failures I might have were due to the lamps: "What about my shutter, speedgun and battery, could I guarantee that they never varied?"

I suggested that a perfect lamp might become upset during the long journey to England, as I did not think they had enough packing. To disprove this Mr. Manders dropped a lamp on to his carpet and kicked it over to me; I kicked it back to him, and we did this

GRACIE AND VICTOR. A candid shot at $1/50$ th sec., f/4, I.S.S.

that this branch of photography will always have a small percentage of failures which cannot be accounted for, because I am certain the greatest possible care is taken in the manufacture and testing of the Photoflux before it is sent out into this very exacting world.

Never Sure.

L. M. (Hobart, Tasmania), sends me a very interesting letter *re* Champlin No. 15, and closes with giving his results from experimenting with mercury hypersensitising. Under identical conditions he sometimes obtained a distinct increase of film speed, whilst at others he obtained fog with no increase. The Kodak Research Laboratory at Melbourne informed him that this was characteristic of the process.

Indoor Weather.

Mud, mud, and still more mud. At Denham, Fox Films are making "He Was Her Man." Monty Banks, the director, invited me to visit the main street of Johannesburg, and here I found it, a foot deep and being kept in perfect condition by a nigger with a hosepipe.

Protected with gum-boots, I made my way to the shack of an hotel where Gracie Fields and Victor MacLagan were due to arrive; "Candid" shots were easy in the light, which allowed me to work at $1/50$ th.

I had nearly reached dry land again, when one of the leading mules in the coach stumbled; up to that moment I had managed to keep fairly clean, but it was half an hour later before I was in a fit condition to start back to London.

THE LAMP I DREAM ABOUT BUT CANNOT BUY.

several times. He then invited me to treat it as I would a cocktail shaker; this I did, and then took a photograph with it, and the result I find on development is perfect synchronisation, so that ends that argument.

The conclusion I have arrived at is

TEN GUINEAS AND UNDER A Section for the User of the Inexpensive Miniature.

IT HAPPENED HERE By K. J. LYON.

CARPISDALE AND THE KYLES OF SUTHERLAND.
The scene of Montrose's last battle.

A SHORT time ago, having to make a journey to the Highlands on business, I decided to take a camera with me, and get as many pictures as I could of places connected with the history of the county to which I was going. With this end in view, I dug out an ancient 5x4 double extension plate camera, a relic of my school-days, and not used for more years than I should care to count. I took it to a local dealer to be overhauled, and while in his shop I noticed a tiny Voigtlander Brilliant. The contrast between it and my cumbersome old friend was so striking that I carried it home for a trial, and became an immediate convert to its charms. It seemed to be the very thing for the job.

Armed with my two cameras, I invaded the county of Sutherland. Ancestors of mine had done likewise, but they had carried more lethal weapons, and were accompanied by a number of friends. I soon found the Brilliant did all the work I wanted, in half the time and at a third of the cost of the plate camera, and that the difficulty was to restrain myself to a reasonable number of Panatomic spools, for though anyone who has taken a camera to the Highlands soon yearns never again to see another picture of Highland cattle, Cairn terriers, or black-faced sheep with curly horns, there are so many other tempting shots like the one taken on the banks of the Ogkell that it is sometimes difficult to get along at all.

I had not the opportunity of making records of as many places as I had planned to do, but I found the interest of taking picture of this sort even

greater than I had expected. Sutherland is rich in historical associations, and the general landscape cannot have altered much since St. Gilbert raised his cathedral in Dornoch, or Andrew Kynnard took "seisin" of his lands on the stairway of his castle of Skelbo. Farther to the west, no country is more weird and beautiful than Assynt, and nothing more romantic than the lonely tower on the shores of its loch. Those crumbling walls saw the great Montrose a starving, weary prisoner; and from there he started on his dolorous journey south, that was to end on the scaffold in Edinburgh.

My Brilliant has an f/6.3 lens, and, the weather being stormy and dull, I took most of the snapshots at full aperture, or if using a screen I used f/11 and a short time exposure. These,

THE RIVER OGKELL, SUTHERLAND.
Typical of the beauty of the countryside.

of course, are exposures of winter length; in anything like good weather snapshot exposures can be made at f/8 or f/6.3, even when using a filter, and a stand becomes quite unnecessary except for any interiors that might be attempted or for subjects taken under trees. Woodland views, by the way, I find to require unexpectedly long exposures; this may be due to the inability of the eye to realise the great decrease in

light under trees. On my next move north, I hope to record some of the scenes connected with clan history; and to make legend more vivid with the thought that "It happened here!"

ARDREFF Castle, Assynt. Within these walls Montrose was imprisoned before his execution.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

CHOICE OF PAPER.

I have started to make my own enlarged prints, and find great difficulty in deciding what grade of paper (contrast, medium or soft) should be used for any particular negative. Can you give me any sort of general rule or hint? R. E. E. (Kent.)

Short of making laboratory measurements on each negative nothing but experience can be of any use to you. A good way of gaining some experience quickly is to make prints on several different papers from the same negative and examine the result in conjunction with the negative. If you do this with a few typical negatives you will soon find no difficulty in deciding, on examining a negative or the projected image, which is likely to be the best paper to use.

BUBBLES IN LENSES.

I have just bought a miniature fitted with a lens marked "Tessar." On examining the lens I find several small air-bubbles near the optical axis. Is this in order, or have I been sold a pup? H. H. (Hants.)

There is nothing detrimental in the small air-bubbles in your lens. They are characteristic of the particular kind of glass used in making the best lenses, and Messrs. Zeiss would certainly not put on the market a lens which was in any way defective.

A SPOILT COLOUR FILM.

An Agfacolor film of mine has been developed and fixed as though it were Isopan F. It presents an almost opaque slatey-brown appearance, but when held to a strong light quite good "frames" appear. Can it be enlarged, either for colour or monochrome results? T. E. C. (Birmingham.)

You do not say if your frames show colour, and if so whether the tints are correct, so we cannot say if colour results can still be had from it. The probabilities, however, are against it. But if you have a good image, coloured or not, you can certainly get monochrome prints from it by giving a sufficient exposure and by using a suitable grade of paper. If the negatives are too flat, you can still make a positive by contact, and from that a fresh negative, adjusting the contrast as you please in the process.

DRYING FILMS QUICKLY.

Can you tell me of a method of drying films quickly? A. G. D. (London.)

There are several methods of drying films quickly, but most of them require the use of special apparatus and conveniences. If, after the final washing, you give the films three or four minutes in a 10 per cent solution of formalin and then remove the surface water, the films will stand surprisingly warm air for drying without the gelatine melting.

GRAIN.

I have recently acquired an Ensign Double-8 camera, the negatives from which I intend to enlarge mostly to 4-pl. size, though the best will be enlarged to whole-plate. How seriously would the grain of my films be affected if I used an ordinary (non-fine-grain) developer? A. H. G. (Essex.)

We cannot give you any exact information as to the amount by which grain will be increased by using ordinary pyro-soda or M.Q. developer as compared with a fine-grain developer, for some films have inherently more grain than others, but we ourselves should not dream of attempting to develop films to be enlarged from 3x4 cm. to whole-plate size in any but a fine-grain developer.

CHEAP F/1.5 LENSES.

Some time ago there was a note in "The A.P." regarding the use of plastic material from which lenses could be moulded. These lenses were to be very perfect and very cheap, but I have heard no more of it. When am I likely to be able to buy a top-line miniature with f/1.5 lens (or faster) at about £10? A. V. (London.)

We have heard no further news regarding the production of lenses moulded from plastic material, nor, on general optical grounds, do we think it would be at all probable that a properly corrected lens of such aperture could be made in this way unless a wide range of materials were available from which to make the different components.

For simpler optical systems, as, for example, viewfinders, this material is already finding wide application, but we think you would be very unwise to refrain from buying a miniature in the expectation that such a camera as you describe will shortly be available.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDXVI.

Dr. P. W. D.
GODDARD.

From information communicated to our Special Representative.

"I HAVE always been fascinated by precision instruments, and I was early infected by the insidious Bacillus Photographicus through the medium of the Leica camera. Since that day I have been one of the great photographic majority, no beginner, but still very much of a learner, and always ready to learn. I learn by attending photographic exhibitions, by studying the photographs of my friends, by reading such publications as *The Amateur Photographer* and chiefly (and expensively) by my own mistakes. At any rate I manage to increase my photographic knowledge steadily and continuously.

"There are few branches of photography upon which at some time I have not tried my hand, but my chief interests lie in church interiors and in animal studies, zoological as

opposed to domestic. For church interiors, which are generally time exposures, I use a rigid wooden tripod, a lens hood as routine, and generally a long-focus lens to avoid distortion. I always expose two or three frames on the same subject for interior work, owing to the difficulty of the exact estimation of exposure time.

"The negative is developed in Champlin 15, and postcard prints made from every frame, no matter how unprepossessing its appearance. A certain proportion of the negatives are now destroyed and the more promising of them are printed up to whole-plate size. Until this stage it is impossible to say whether a negative has exhibition possibilities or not. As I prefer to work for six or eight hours at a time in the dark-room the promising negatives are straightway printed up to 15 by 12 in. Next comes the choice of paper, and I sometimes find this difficult owing to the enormous numbers of excellent products on the market, and I still use a large variety of paper. For church interiors I use Kodak Antique Royal or Clorona Chlorobromide and sometimes Gevaluxe, a paper for which I have a great admiration. The animal studies are mostly done on Kodak Tinted Royal or Ilford bromide, but to every negative its own paper.

"My aims have always been in the direction of simplicity; simplicity of subject, treatment and presentation. I would infinitely rather produce a picture of a summer landscape which gives the observer the impression of summer, than collect seven cigarette ends, a back stud and a Roman denarius, photograph the ensemble with strong side lighting and call it 'Frustration.' But opinions differ!

"I have been through the almost unavoidable controversies of reflex *v.* range-finder, this developer *v.* that developer, and miniature *v.* the rest. At various times I have owned and used a Leica, a Rolleiflex, an Exakta, a Super Ikonta and others, but nowadays I use only the Leica, and I see no reason to change. With this camera I have a 13.5-cm. lens, a 2.8-cm. lens and the standard Summar, and using these three lenses I find that I can cover every subject I want to photograph.

"As regards emulsions I use five times as much Isopan F as anything else, as by now I know it inside out; its speed is remarkably constant, and I do not think anyone could quarrel with its grain nowadays, especially when used in conjunction with Champlin 15, with which I now work almost exclusively, although for interior zoological work Atomal or D.76 in conjunction with Agfa I.S.S. is my choice.

"With the ever increasing efforts of the photographic manufacturers and the amateur researchers, grain has ceased to be the boggy that it was, and in my opinion camera shake and a dirty dark-room are more deadly enemies than grain, although one hears more about the latter.

"Finally, there is no formula to ensure a successful print every time the shutter is opened (and I hope there never will be!), but I think that the secrets of good picture-making lie in simplicity of composition, in using a camera, emulsion and paper that are tried friends, and in using a fine-grain film rather than seeking any particular Philosopher's Stone in the way of developmental formulae."

(A further example of Dr. Goddard's work is reproduced on one of the centre Art pages.)

SEPTEMBER.

P. W. D. Goddard.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"ERRAND OF MERCY," by Arthur G. Dell.

QUITE a considerable proportion of the charm that this picture exhibits arises from its attractive expression of the feeling of luminosity, and, curiously enough, it is one of those rare cases where the quality has its origin in the sunlit horizontals rather than from the sky or from the effect of sunshine on the verticals.

It is very well chosen indeed and well merits the honour it has achieved

in attaining the first place in the recent photographic competition initiated by Wallace Heaton. It is simple in arrangement; it is technically sound, and the inclusion of the figure not only lends it human interest, but also accentuates the impression of light. It does this because the figure, as the centre of interest, demands the major share of the attention, and because it is about the darkest note in the whole thing, its depth of tone contrasting very forcibly, and therefore showing off, the light against which it comes. Its shadow, too, is a help, and so are the darks of the two foreground trees, together with their shadows, which act in a similar sort of way.

Beyond these strong and forceful tones is a distance of moderately deep half-tone, which also throws a shadow, and, in between, the narrow strip of light is placed, so that, for all practical purposes, it is enclosed. It is true that the lighter tone does run down to the base, but its value deepens the nearer it gets, and there is a sense of limitation arising both from this and from the shadows of the figure and trees that seems to restrict the light to the space above. It gains enormously from this restriction and, what

with that and the conjunction of strong tone previously referred to, the effect is very vividly and vivaciously conveyed.

It gets across with tremendous force and I like it immensely. But I should like to point out that much of the virtue of the effect rests with the *contre-jour* lighting. It is only with such a lighting that the sunlit horizontals would attain their value; that the trees and figure would show so power-

has been confirmed, I do not think that anyone would fail to agree that its tone should either be subdued substantially or removed by trimming.

The subject would lose little or nothing by the slight reduction in scale, but it is possible that the length might be thought to be rather long for the height. If so, a little local control would enable the tone to be suitably lowered, and, in the end, the effect would be much about the same.

There is, however, a tiny figure in the distance, to the rear of the nun, which is inclined to catch the eye unduly. If it were balanced by another figure of about the same size, in front of the other but nearer the tree on the left, the arrangement would be acceptable, but as nothing of the sort is visible, it would be better if that figure were removed by re-touching—not a very difficult job, and one that might be done partly on the negative and partly on the print, the

fully against the light; that the distance would be so beautifully massed and its detail merged into what is almost even tone; and that the shadows, on which so much depends, would be cast towards the viewer, while the suggestion of atmosphere is also attributable to the same cause.

The impression, as a whole, is delightful, but I am inclined to doubt the wisdom of including that patch of sky at the top. I feel that its tone is not only too bright for its position, but that it pulls away from the centre of interest which lies underneath in the neighbourhood of the figure. Moreover, it diminishes the value of the sunshine on the cobbles below. Cover it up and the effect of the sunshine is vastly enhanced, and, once this

transparent spaces on the negative being filled up to match the surrounding tone, and the lights on the print being similarly removed. These, however, are somewhat minor matters.

To those who would like to try their hands at similar effects, I would say that a lens hood is a necessity for scenes such as this which are taken against the light, or steps should be taken to prevent the direct rays of the sun from falling on the lens, failing which, the image will almost certainly be fogged or ghost or flare may make an appearance. It would be sufficient if the lens were placed in shadow, but these do not often happen when or where they are needed, and, on the whole, the hood is more efficient and always available. "MENTOR."

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

THE sky, with its finely graded clouds, and the little there is of distance in No. 1 of the prints reproduced on the opposite page—"In the Dolomites," by Miss K. L. Wigglesworth—are excellent features for treatment as part of a landscape subject, but the remainder, I fear, has rather awkward lines and does not make up very well.

Mountain Landscape.

In this, it is characteristic of the difficulty that is encountered in the pursuit of pictures in the midst of mountains. It often happens that a glimpse of an entrancing bit of distance is caught, but that, at that particular moment, the foreground or the middle distance, or both, do not fit in with it very well.

But it seems sufficiently promising to encourage us to push on in the hope of getting a suitable composition—without which all landscape is vain—and on we go and on, perhaps eventually to be rewarded with something of what we imagined, but, more probably, only to find that, when the foreground is better disposed, the distance has changed and bears little relation to our first impression.

Such a result is most discouraging. I can sympathise most feelingly, for that has been my experience over and over again. Nowadays, however, when I do see a nice piece of distance, I do not go on, unless I can see a distinct possibility of a good foreground reasonably near at hand, but scout round the immediate neighbourhood for something that fits in. If the middle distance accords with the distance at the first sight, it is usually possible to find a foreground by moving to one side or other or retreating or advancing a bit, the amount being limited by the extent of movement which can be made without the relationship between middle distance and distance being substantially altered.

Making a Subject.

If the middle distance is a good way off, quite a considerable degree of movement would be available if the nature of the ground permitted, but I have found that, as long as there is no loss of height, a reasonably satisfying foreground can be found without going very far.

On the other hand, a subject which shows a good distance but has an obstructive middle distance, like that of No. 1, is much more elusive. If, by going on, a higher viewpoint seems likely, it may be worth while, for the higher we get the more the distance asserts itself and the less the middle distance, but sometimes it happens that a considerable gain in height can be made without much lateral movement.

Whether the expedient is possible or not in this instance is impossible to say, but, before it could be useful, the height attained would have to be as great or greater than the ridge behind the trees which hides the lower stretches of the distant mountain.

And that would mean a bit of a climb, so much so that if the ground does not rise sharply either to the right or left, a possibility that does not appear very likely, it would be better to go on till the ridge is surmounted. More often than not, the best aspect is seen from the top of a pass or from a ridge before a descent, and, speaking for myself, I would be very reluctant to leave before I had explored all the possibilities available, or, at least, those in the immediate neighbourhood.

Retaining Height.

At all events, I would make quite sure that I was losing nothing before descending, and, quite frankly, I think the retention of height in the making of mountain subjects is of the first importance.

The position is much the same with town work where the distance is significant. There is, for example, a fine prospect of Edinburgh from Calton Hill; in Liverpool, the height of the Liver Buildings is most impressive seen from some of the more lofty buildings of Water Street, the south end of Castle Street, or James Street; and most of us will have recollections of the fine presentation of St. Paul's with a foreground of rooftops which was shown at the Royal in 1935.

But open landscape in flatter country very seldom shows to advantage when seen from on high. In point of fact and as a general rule, the low viewpoint is preferable because it lowers the level of the horizon in the

picture, gives a proper proportion of space to the sky, and enables the qualities of light and space to be successfully transmitted.

Some Examples.

No. 2, "Ellesmere Port Wharf," by Thomas Jones, if not a landscape in the strict sense of the term, partakes of many of its characteristics, and the low point of view has permitted the sky to occupy a sufficient proportion of the picture space to convey a feeling of light and space.

The leader of the two vessels is rather centrally placed, and I think a better arrangement would result if something like half an inch were trimmed from the left. With No. 7, "Freiburg Market," by H. R. Collier, a higher viewpoint has been chosen and the jumpiness of the lines in perspective is apparent, while the upper portion of the print seems to have been fogged.

In No. 5, "Transportation," by Cheung Shin Chung, however, the lines are mainly inclined to horizontal and the perspective is not obviously affected. The height of the viewpoint, too, has enabled the boats to be separated in a way that would not be feasible from a lower standpoint, and in a subject of this nature the absence of a sky is inclined to be an advantage. The figure in No. 4, "A Dirty Job," by J. Webb, would be inclined to stand out more effectively if more of his outline came against the sky, and, as far as viewpoint is concerned, it seems probable that none other was available.

The Normal Viewpoint.

Nos. 3 and 6, "From my Window," by F. E. Williscroft, and "Going Up," by B. K. Grimshaw, represent the normal point of view, for although, in the former, the landscape through the window is seen from above the ordinary height, it is the window itself that is the subject and not the landscape at all, while, in the latter, the subject seems rather constricted owing to a lack of sufficient space at the base and top.

Seen from a greater viewing distance, the subject would not be unattractive, but more might be made of it if the sunshine were more evident.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

IMPROVISING AN ENLARGER—I.

MAKE no apology for once again going over some of the facts about enlargers, because there is a constant supply of new beginners who have reached the stage at which they want to make enlargements from their small negatives. This is a very laudable wish, but they often have curious ideas about being able to improvise the necessary apparatus. They would never think of asking "How can I make a camera?" but they certainly ask, in large numbers, "How can I make an enlarger?"

A good deal of their confidence in being able to do this arises from the idea that they can use their camera as an enlarger by some slight and simple addition to it. There is a lot more in it than that; and as a matter of fact the majority of the cameras that beginners use are quite unsuitable for any such purpose.

The basic principle of making an enlargement is that we photograph a negative on to a sheet of bromide paper. But to do this successfully we must make certain arrangements. We must have the negative illuminated brightly and evenly; we must be able to move the lens nearer to the negative or farther from it, so as to get our photographs the size we want; as we move the lens to different positions we must be able to vary the distance of the paper from the lens so as to get the image in focus; and we must see that

Fig. 2.

no other actinic light falls on the paper than that forming the image.

All these arrangements *must* be made; and there are several others which, although convenient, are not absolutely necessary. There are so many variations in carrying out the arrangements that enlarging apparatus assumes all sorts of appearances, so different that it is difficult to believe that they are all intended for the same job.

I am once more going to run over some of the *essentials* of an enlarger, whatever its construction. I did this recently for a friend, who had no difficulty about constructional work, but realised that it was first necessary to understand the general principles. In a very short time he was turning out excellent enlargements, and I am hoping that he will shortly give us an illustrated description of how he solved the various problems in a simple and efficient manner, and at a very low cost.

Beginners should remember, though, that he is a skilled craftsman. I told him what was wanted, and not how to construct it. *He* saw to that part. And in my opinion no one is likely to be able to improvise a proper enlarger who needs to be told how to carry out every little detail of the construction.

Fig. 1 shows a typical enlarger of a standard and highly efficient type.

On the left is the metal lamphouse, intended for an illuminant other than the electric light with which it is now fitted. Hence the rather elaborate ventilation, the window for examining the light, and the door to give access to it. The curtain at the back is to intercept the light which by reflection would be dangerous. But even for electric light the lamphouse must be ventilated; it must be "trapped" to prevent light coming out where air goes in; and it must not be damaged by heat.

The lamphouse travels backwards and

Fig. 1.

forwards by rack and pinion, and the tray carrying the lamp also moves to and fro in grooves inside the lamp-house. The condenser is in the mahogany casing in the middle of the apparatus, and the space between the two is filled by the expanding iron cylinder. This is often replaced by bellows. Immediately in front of the condenser is the carrier for the negative.

It is easy to see the resemblance of all the front part of the enlarger to a field camera. The front carrying the lens (not shown) racks to and fro by rack and pinion, and the bellows allow for very long extension. Hence the idea that a camera may form the front of an enlarger. So it may, if it is the right sort. But how many modern cameras are the right sort?

The main point is that the lens can be moved to different positions in relation to the negative, with sufficient extension to allow a maximum distance of about twice the focal length of the lens. Another point is that the back of the camera can be open and permit of a light-tight junction with the rest of the apparatus.

Even with only a single lamp a condenser can often be dispensed with, provided the negative is small. In Fig. 2 the lamp is marked L, and AC represents the diagonal of the negative. It is evident that the rays LA and LC reaching the corners of the negative are longer than the ray LB reaching the centre. The nearer the lamp is brought to the negative the greater becomes the difference. If a piece of ground glass is put between the light and the negative it diffuses the rays and minimises the unevenness.

Fig. 3.

Sometimes two glasses are necessary. The best distance for the lamp must be found by trial.

Fig. 3 illustrates an important point where a condenser is used. In both diagrams L is the lamp, C the condenser and O the objective. The condenser picks up rays from the lamp and focusses them into the lens. As the lens occupies different positions according to the degree of enlargement it is necessary to be able to alter this focus. At the top of the diagram the light is moved away from the condenser and the focus is shortened; below, the light is nearer to the condenser and the focus is lengthened. W. L. F. W.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

FILM SPOOL SUGGESTIONS.

SIR,—I was much interested in the letter by "Practical" in your issue of November 17th, on the above subject, as I, too, have experienced difficulty with the different makes of spools. I have proved, however, that your correspondent is incorrect by stating "Agfa films appear to fit all cameras on the British market." My camera is also a well-known German make, taking eight exposures on $3\frac{1}{4} \times 2\frac{1}{4}$ film, but whereas No. 120 Kodak film fits it perfectly, I have found that Agfa spools, being just a minute fraction shorter, do not wind up straight, and after about the seventh exposure begin to bind on the metal end and eventually run over the edge. A further point I have noticed is that the slot of the Agfa spool is wider than that of the Kodak make, thus leaving a certain amount of play between the groove and the winder key in the former, and this was responsible on one occasion for wearing away the wood core so that I was unable to finish winding off the film.—Yours, etc., "BEGINNER."

MOVEMENT.

SIR,—W. L. F. Wastell's comments on the individual who insists on movement in photography are particularly apt. One of the misfortunes of living in a much too mechanical age is that the more obvious forms of sensation of all kinds: thrills, speed, noise and movement; become particularly appealing to minds that are so jaded as to be incapable of appreciating anything else.

There are literally millions of such people in this country and throughout Europe. The desire for movement in photography is not only symptomatic of a completely barren type of mind but also furnishes an alarming indication of the state of affairs that modern conditions are every day bringing about.

Exceptional stimulus is only needed when the mind is numbed; never otherwise. The greater the degree of awareness of the individual the more vitally interesting does everything become. As in photography, so in any other art. In the long run the beholder gets out of it exactly what he takes to it—and no more.—Yours, etc., "AMATEUR."

"MINIATURE v. REFLEX."

SIR,—The article "Miniature versus Reflex" is somewhat unjust to the reflex, as the focus for the self-portrait could have been got as readily on the reflex screen, as by scale on the miniature; though the miniature camera is likely to give more margin for error in direction, and is to be preferred where view-finder or screen cannot be used.

When a reflex camera has to stand on a ledge or similar awkward place, where the screen is difficult to examine, focus the ledge from the position which is to be occupied by the person to be photographed, then place the camera on the ledge to make the exposure.—Yours, etc., W. A. CATHER.

WHY USE A TANK?

SIR,—Referring to the see-saw method of developing roll films, Mr. W. L. F. W. states that it is "decidedly inferior to the tank method," but he does not give reasons for this remark.

I consider that a $2\frac{1}{4}$ film can be properly developed in a dish, using only one pair of Rytol Tabloids in 4 oz. of water, and for the time given in the "Wellcome" tables. The complete process, including fixing, occupies considerably less time than when a tank is used, and is economical in comparison.

Messrs. Burroughs Wellcome & Co. state that their tables "produce negatives of average contrast"—surely this is a most desirable result to obtain!

I am aware that the Wellcome Handbook mentions special circumstances in which the developing time should be increased.

So far as I know, the only advantage of developing roll films in a tank is that a dark-room is not required. A film pack or twelve plates could be developed in less time if a tank were used, but I doubt if the resulting negatives would be of superior quality to those developed in a dish.—Yours, etc., "ELEPHANT."

MAKING TRIAL EXPOSURES.

SIR,—Your contributor of "Some Notes on Artificial Light Photography" in a recent issue appears to have made a slip as regards "Making Trial Exposures." Opening the dark slide by a quarter at a time and giving a series of exposures of one, one, two and four seconds will not give a graded series of one, two, four and eight, but will give eight, seven, six and four.

Either the series of exposures should be reversed (4, 2, 1, 1) or the first exposure should be given with the slide fully open and the others with it closed by quarters.—Yours, etc., JOHN WILSON.

MAKING BETTER SNAPSHOTS-28

By DAVID CHARLES.

This article is the twenty-eighth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1.—Fog subjects consist of outlined shapes. They afford good practice in point-of-view selection.

Fig. 2.—Even in a fog good use can be made of differing points of view upon the same subject.

Fig. 3.—Use of a filter, or of contrasty paper, "cuts out" most of the fog. This is neither one thing nor the other; neither a fog-picture nor a "good photograph."

WHEN fog begins to threaten, everybody who can hurries homeward to the fireside. Everybody, that is to say, excepting the enterprising photographer in search of pictorial subjects for his camera. For there is no doubt that a touch of fog often lends a touch of mysterious enchantment to what is ordinarily commonplace or even ugly. Not so long ago I read in a book review of a world traveller whose great delight was waking up to see, not the everlastingly quoted white cliffs of Dover, but the spire of St. Pancras looming through the fog. The station, mark you, not the church!

Grey Silhouettes.

Well, whether my photograph of that same railway station spire, as it met my eyes one foggy morning, does, or does not, succeed in conveying just what that traveller felt about it, at any rate it demonstrates effectively some of the essential points about making fog-pictures. It will be noticed first that all the details of the picture appear to consist of a series of grey silhouettes of various more or less distinct shapes. In other words it is only their outlines by which component parts of the picture are recognised. So the lesson to be learnt is that for making pictures of a city building in a fog one should look for masses with characteristic outlines, and take care to select a viewpoint which will show the principal outlines against another mass or shape of different tone.

It is quite possible, provided the fog does not altogether blot out the landscape, to use a deep

red filter on the lens, or to go the whole hog and use infra-red technique to the end of reproducing those buildings just as clearly as though no fog were present. It is also possible to print the rather delicate negatives that fog pictures give on extra-contrast paper. To do that will to some extent "bring out" the detail in the nearer parts where most detail usually is seen, and will make the distant details fainter than ever, against a perfectly white sky. That is what a friend had done, who brought me Fig. 3 to criticise. It does to some extent look like Westminster does in the mist of an early spring morning. But not a bit like London fog. In a fog, things near to loom up dark but the fog in Fig. 3 is only in the distance; that on the river and bridge has been removed by printing what seemed a too soft negative on "hard" paper.

Care in the Dark-room.

On the other hand it is essential that any subject such as these, which consist rather of areas of tone than of small details, should be processed with more than usual care at every single stage of the work. For there is nothing like them to show up one's faults in processing. Dust, whether in the camera or in the enlarger, will surely show its presence, for specks show up the more boldly on areas of even grey.

But when one recognises the peculiar charm given by the tactful veil of fog to even the ugliest erections of man's efforts, as in Fig. 4, the extra trouble seems worth while.

Fig. 4.—Fog always lends enchantment to the dreariest of scenes. Too deep a filter would bring back the reality.

Photographic Christmas Cards

By RAYMOND F. COTTON.

THE usual method of using one's own photographs for Christmas greetings cards is to mount them on professionally printed cards containing the greetings design. This is the easy way if the amateur has little time to spare, but if he prefers a more personal offering there is still time to adopt the following method, which is entirely photographic and gives a greater variety of results at a lesser cost.

First of all, the greetings and decoration must be drawn in indian ink on a smooth, white card. (Examples of forms of lettering and decoration may be found on last

between the picture and the greetings. The frame shown in Fig. 2 consists of a cardboard base with guides for the bromide card. Fixed to the base by linen hinges are two masks. The position and size of the openings in these can be ascertained by projecting the image of the greetings negative on to them, and marking the corners of the picture space and the outer edge of the decoration respectively. The base should be white, for ease of focussing, and the masks should be painted a dull black.

We now come to the actual printing of the cards. A greetings negative is inserted in the enlarger, and the image is projected to the correct size on to the base of the masking-frame, which is then fixed in the correct position on the enlarger easel. The exposure required to give pure black lines without "veiling" the white parts is found by the usual test strip, and this exposure is given to the required number of sheets of paper. A mark is made at one end of the back of each sheet to correspond with a similar mark on the frame; this is to ensure them being replaced correctly for the next operation. These sheets are not developed, but put away in a light-tight box.

A suitable picture negative is now inserted in the enlarger, in place of the copy negative. This image is focussed to the desired size, and the masking frame fixed in a new position to bring the image into the space in the picture mask. After determining the correct exposure, the batch of cards is again exposed with the picture mask in position.

These cards may now be developed and finished in the usual way. A blue-black image on a white velvet surface will be found to give the most pleasing results, but variations in tone and surface may be made to suit individual taste. A "contrasty" paper should be used to ensure clear whites.

The variety of designs is limited only by the photographer's patience in making masking frames and copy negatives. Suitable pictures are easy to find among your negatives. Landscapes, especially those with snow, and snapshots of children on animals are typical subjects. An interesting further development, which, however, I have not tried as yet, is to replace the name of the sender with a small "head and shoulders" portrait. This idea would be especially appealing on cards sent to friends overseas.

FIG. 1. Prints from two copy negatives, showing picture spaces and sizes of finished cards

year's Christmas cards.) This card is then pinned on a wall or drawing-board and photographed on a slow film or plate. The ideal is to use a process plate, and in fact this is almost essential if the white areas of the finished cards are to be absolutely clear.

Artificial light is best and the card should be illuminated equally from the sides, as front lighting may give trouble because of reflections from the ink lines, which are sometimes shiny if too much ink has been used. Negatives obtained in this way should consist of dense black and clear gelatine with no half-tones. This result is easily secured by correct exposure and development with full-strength M.Q. developer and a double quantity of bromide. Fig. 1 shows prints from two of these negatives, and also the sizes of the finished cards.

The next essential is a card holder to ensure register

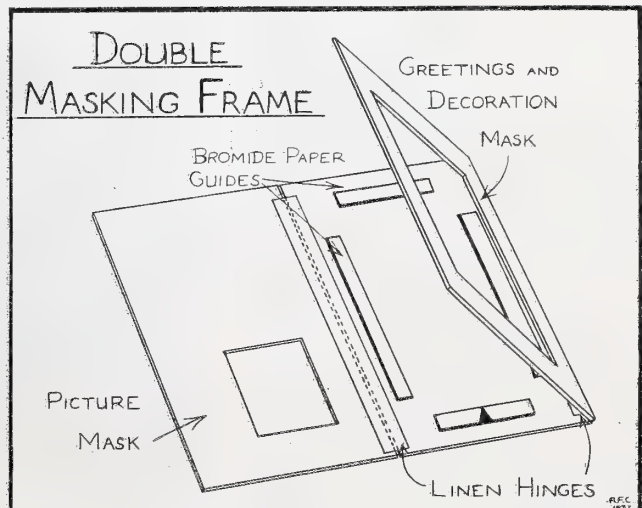

FIG. 2. Sketch showing details of construction of masking frame.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Christmas at Home for the Amateur Cinematographer

By
SIGURD MOIR.

THE coming Christmas is certain to mean a spell of hectic activity for the ciné enthusiast who spends his holidays at home. To begin with, there are to be three days of festive entertainment—all the high-spots of which should be adequately filmed—with a big screen show to wind up the frolics of each day.

Perhaps the heaviest work will be encountered in connection with the planning of these big shows—where smoothness and absence of hitch will naturally depend upon the manner in which one goes about the task.

In previous years it has been found most convenient to consider all the shows together for the purpose of arranging the "cinema," projection details and the separate programmes. Here, the cinematographer should endeavour to utilise any assistance that may be available in the various departments concerned. He may, for example, leave the choice and arrangement of a suitable projection apartment in the hands of a capable friend. And, since he is expected to play the part of a normal host throughout the Christmas proceedings, it is also advisable to "appoint" a skilled operator in charge of all projection activities.

In this way, the amateur himself is left more or less free to tackle the important problems of programme selection.

The Theatre.

The room or apartment selected for the big shows should be conveniently situated and should be sufficiently large to accommodate all the invited guests in comfort. Now, for those who are fortunate enough to have a permanent cinema erected in the home, this is not going to present much of a problem; nor is much trouble likely to be experienced in large, old-fashioned residences where a good selection of apartments is available.

Difficulty is likely to occur, however, in the modern small houses and where all the available apartments are already occupied in catering for the more normal comforts of the guests.

To meet this difficulty, then, it is advisable to select the projection room without delay and to rehearse the necessary "scene-shifting" which will have to be accomplished for the shows proper. The major points to observe are that there will be only a minimum of discomfort caused by the temporary rearrangement of seating and the erec-

tion of apparatus, etc., and that the screen, projector and the cable are all left as nearly as possible in position for a slick set-up.

Programmes.

The arrangement of programmes is another matter which should be gone into without delay. Any shots taken at the last Christmas gathering will obviously have to be shown—as will the yuletide reels of any other enthusiast who may happen to be staying over the present holidays.

Apart from these, the only other personal films suitable for inclusion in the programme will be those which are held to possess nice qualities of cinema and (of course) outstanding personal features.

Such films will provide a nucleus for the three big displays; but they will seldom be sufficient to fill the full programmes. Other subjects must be ob-

tained—and for these it is essential to make contact with those who have a supply of suitable films available.

Perhaps the libraries (like the Film and Photo League, Kodak Ltd., Wallace Heaton, Ensign Ltd., etc.) have the finest selection of these; but always success depends upon the ability of the amateur himself to make a suitable choice. Stereotyped rubbish of the professional cinema is certainly *not* suitable—though some of its surprising triumphs (many of which have been reduced to 9 mm. and 16 mm.) can be included in any programme arranged for people of good taste and average intelligence.

It is most important, when ordering library films, to specify one or two alternative titles required in the event of the first choice being already booked out over the period required. Where this is not done, the librarians are apt to make their own selection—not always

In many parts of the country there have already been heavy snowfalls. Many attractive action pictures of tobogganing on hillsides will add variety to the winter bag of the amateur cinematographer.

to the entire satisfaction of the hirer.

The Shows.

It is advisable to have the shows commence at a fixed time every evening—say, during the interval between tea and dinner. Furthermore, this time and other details of the shows should be made known to the guests in ample time to

foster the fullest interest and co-operation.

Immediately on an arranged signal, the display assistant should run up his screen and prepare the reels for showing. At the same time, it is not difficult to persuade one or two of the guests to place "key" chairs in position as guides for the remaining seats—which

can be moved, where necessary, by the guests themselves.

Other details of the shows conform strictly to ordinary procedure, the operator being well "on his toes"—as it were—to ensure that not the slightest mishap will intrude to mar the quality of his workmanship on these very special occasions.

A Note on Television

MR. T. C. MACNAMARA, of the Engineering Staff of the B.B.C. at the Alexandra Palace, had an interesting account to give to the Royal Photographic Society the other evening of television. The number of frames per second sent out in television is about forty; this number makes the flicker imperceptible. The ordinary cinematograph employs twenty-four frames per second, which is sufficient to give a good impression of continuity of movement, but if it were not for the three-bladed shutter, which in effect increases the frequency to seventy-two, there would be a good deal of flicker.

Television uses a similar artifice in the form of interlacing. Thus instead of scanning a picture in a sequential series of lines, line 2 close up against line 1, and so on, each frame is scanned in two actual scans, or, in other words, the scan of each picture frame is completed in two separate half-scans, with the result that the frequency is increased to 40 or 50 from the eye's point of view, at which value flicker practically disappears.

All this is done without sensibly increasing the frequency band set up. If the picture were reproduced at the

usual rate of 25 frames per second, the flicker would be rather serious, but if the number were increased to 50 the frequency band would become unmanageable. By the device just described, having effectively 50 half-scans per second, the trouble is avoided.

In the television studio at Alexandra Palace there are four cameras, with two others specially assigned to the television of cinema film. The enforced use of the ultra-short wave-length limits safe reception of television to something like twenty-five to thirty-five miles. Mr. Macnamara told his R.P.S. audience that he had seen quite a good picture at eighty miles, but that anything above thirty-five miles must be regarded as a freak. This is a severe handicap on television, but there is no known way of overcoming it at present.

Ordinary daylight is extremely good for television. The intensity of the light in the studio is about 200 foot-candles, so that it is not as bright as that used in colour cinematography, and not much brighter than that used for the majority of ordinary black-and-white filming. The cameras can be taken out into the grounds of the Palace and used for

televising demonstrations of horsemanship, physical training, and so forth, but a limitation is imposed by the length of cable. The thick cable cannot be used in lengths of more than 1,000 ft., so that the camera cannot be taken more than that distance from the control room.

A mobile television unit has been formed, consisting of a motor van in which is contained all the apparatus necessary to generate a television picture for three cameras. After the picture has been generated in the van it has to be taken back to the station at the Palace, and there are two ways of doing this. One is to employ a special form of cable, and a circuit of special television cable does run round the centre of London and the West End, passing a number of points where civic and other functions take place, but its scope is very limited. The other method is to span the distance by a radio link—a vehicle containing an ultra short-wave transmitter, operating at 5 metres and connected to an aerial erection. A signal from this is received at the Palace on a small aerial at the top of the ordinary television mast.

Exhibitions and Competitions

CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, December 31. Rules in issue of November 24.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Winter Snapshot Competition for users of the Purma Special Camera. £100 in cash prizes.—Particulars and entry forms from R. F. Hunter Ltd., 51, Gray's Inn Road, W.C.1.

Bertram Mills' Circus Competition.—Cash prizes for photographs taken during the performances from December 22 to January 25. Extra prizes for winning prints by readers of "The A.P." Particulars in last week's "A.P."

International Photographic Exhibition in Debrecen (Hungary).—Open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

XIe International Fotosalon "Iris".—Open, January, 1938. (F. Geeraerts, Brederodestr, 22, Antwerp, Belgium.)

Preston S.S. (P.S.) Thirteenth Annual Open Photographic Exhibition.—Entry forms, January 7; exhibits, January 14. (F. Wells, 65, Powis Road, Preston, Lancs.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Aberdeen P.A. International Exhibition of Photographic Art.—Entries, January 15; open, February

5-26. (Miss Hilda M. Bailey, 63, Watson Street, Aberdeen.)

Stockton-on-Tees and D.C.C. First Annual Salon of Photography.—Entries, January 15; open, February 7-9, inclusive. (J. Greenwell, 9, Birkley Road, Norton-on-Tees.)

Nottingham and Notts P.S. 34th Annual Exhibition.—Entries, January 21; open, February 7-12. (T. G. Earp, 14, Brushfield Street, Hyson Green, Nottingham.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21—March 12. Last day for entries, January 29. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31; open, March 7-12. (H. D. J. Cole, 11, Woodlands Road, Ilford, Essex.)

L.M.S. (London) P.S. 13th Annual Exhibition.—Entries, February 1; open, March 7-12. (Hon. Exhibition Secretary, L.M.S. (London) Photographic Society, 1, Euston Square, London, N.W.1.)

Birmingham P.S. 47th Annual Exhibition.—Entry forms, February 3; exhibits, February 5; open, February 26-March 12. (E. H. Bellamy, 20, Waterloo Street, Birmingham, 2.)

City of London and Cripplegate P.S. Thirty-third Annual Photographic Exhibition.—Entries, Monday, February 7; open, March 7-12. (R. C. Dye, The Flats, Chesham Road, Wigginton, Tring, Herts.)

Southampton C.C. Open Exhibition.—Entries, February 14; open, February 28-March 19. (Cecil

Chandless, Hon. Exhibition Sec., Southampton C.C., 30, Carlton Crescent, Southampton.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23-26. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April. (Hon. Exhibition Secretary, H. V. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9-April 2; entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Scottish Photographic Federation 30th Scottish National Salon.—Entries, March 2; open, April 2-16. (Percy H. Cartwright, 52, High Street, Galashiels, Scotland.)

Bishop Auckland P.S. Annual Salon.—Entries, March 7; open, March 16-19. (W. G. Ridley, 19, Ravensworth Avenue, Bishop Auckland, Co. Durham.)

Hackney P.S. 49th Annual Exhibition.—Entries, March 7; open, March 30-April 2. (Walter Selfe, 9, Fairlight Avenue, Woodford Green, Essex.)

Derby Railway Institute P.S. Twenty-third Annual Exhibition.—Entries, March 31; open, April 25-30. (J. Radford, Downderry, Spinney Road, Chaddesdon, Derby.)

XVIIe Salon International de Photographie de Belgique.—Entries, April 1; open, May-October. (J. Lejeune, 70, Avenue Van Becelaere, Boitsfort, Brussels, Belgium.)

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, December 15th.

Battersea Men's Inst. C.C. "Flashlight Work for Amateurs." Members.
Bethnal Green C.C. Practical Work.
Birkenhead P.A. Members' Exhibition.
Borough Poly. P.S. "A Tour Through Ford Works."
Brighton and Hove C.C. "Combination Printing." W. E. Ginger.
Carlisle C.C. Beginners' Evening. "Contact Printing."
Chorley P.S. Demonstration. C. Gent.
Croydon C.C. "The Photocolor Process." A. Phillips.
Darwen P.A. One-Man Show. R. Chalmers.
Dennistoun C.G. G.D.U. and Foreign Portfolio.
Ealing P.S. Third Pictorial Competition.
Edinburgh P.S. "Print Criticism in Reference to Composition."
G.E. Mechanics' Inst. P.S. Criticism of Prints and Slides. J. H. Clark.
Hall Green P.S. "Chloro-Bromide Printing." H. T. W. Cotterill.
Hinckley and D.P.S. "Character in Pictorial Photography." C. Taylor.
Ilford P.S. "Making a Good Enlargement." L. L. Vizard.
Kingston Ciné C. "Home Processing." Percy Harris.
Leominster P.S. "Bromoil Transfer." H. J. Gornall.
Letchworth C.C. East Anglian Federation Portfolios.
Mountain Ash C.C. "The Charm of the Village Church."
Northallerton and D.P. and C.S. Members' Ciné Evening.
North-West London C.C. Meeting at Hendon Town Hall.
Partick C.C. Print Competition.
Scarborough P.S. "My American Tour." Mrs. Farrar.
Shropshire C.C. "Film Development." W. A. Lynch.
Solihull P.S. "Pictorial Aims and Reality." F. W. Lawton.
South Essex C.C. "From My Notebook." S. C. Tweedy.
S. Suburban and Catford P.S. "Portraiture." Miss D. C. Galloway.

The Thirty-third Annual Photographic Exhibition of the City of London and Cripplegate Photographic Society will be held at the Cripplegate Institute, Golden Lane, E.C.1., from March 7th-12th, 1938, inclusive. The judge will be Mr. F. J. Mortimer. There are six members' classes, Landscape, Portraiture, Any other subject not included above,

Lantern Slides, Prints—Any Subject (for members who have previously not taken more than three awards), and Beginners. In the Open Class there are two sections, one for Prints and the other for Lantern Slides. Entry forms, with Entries, Fees and Adequate Return Postage must be sent to the Hon. Secretary, "Photographic Exhibition," The Cripple-

gate Institute, Golden Lane, E.C.1., to arrive on or before Monday, February 7th, 1938. Entry forms containing all necessary information may be had from the Hon. Exhibition Secretary, Mr. R. C. Dye, The Flats, Chesham Road, Wiggington, Tring, Herts, or we have a limited supply of these available at this office.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Part II of the Modern Encyclopedia of Photography, published last week, is devoted entirely to the subject of Developing, Developers and Desensitisers. This number is a very complete instructional handbook and guide to these matters and contains 14 separate articles covering every phase of the subject in addition to a special folding chart of 110 developing formulæ. Many illustrations are included and the whole is a remarkable shillingworth. Each weekly part of the Modern Encyclopedia of Photography is obtainable at all bookstalls and booksellers or direct from the Amalgamated Press Ltd., The Fleetway House, Farringdon Street, E.C.4. Readers of "The A.P." who have not yet secured copies should do so without delay. The work will be completed in twenty-six parts.

We hear that the Grand Prix of the International Paris Exhibition, 1937, has been awarded to the Robot miniature camera.

Kodak Ltd. inform us that they are always interested to receive good photographs taken by amateur photographers, and if the photographs are attractive enough they will buy them for use as specimens. The only stipulation is that the negatives must be made on Kodak film and it is desirable, but not necessary, that they should have been taken with a Kodak camera. Many readers of "The A.P." with suitable prints will doubtless like to take advantage of this offer. They should submit photographs in the first instance to A. P. Hynds, Dept. 46, Kodak Ltd., Kingsway, London, W.C.2.

The Metrogas Photographic Society, South Metropolitan Gas Company, 709, Old Kent Road, S.E.15, informs us that Mr. A. G. Higgins has now taken over the Secretaryship of the Club, and in future all communications should be addressed to him at the above address.

A new Society known as the Sutton-in-Ashfield and District Photographic Society has recently been formed, of which the membership is increasing rapidly. Meetings are held every Monday night at 7.30 in the Toc H. Rooms, Low Street, Sutton-in-Ashfield, to which new members will be welcomed. The Hon. Secretary, Mr. S. C. Huffen, 11, Pepper Street, Sutton-in-Ashfield, Notts, will be pleased to hear from any amateur photographers in the district who are interested.

A number of keen amateur photographers have banded together, under the temporary secretaryship of Mr. F. Hart, 14, Barleycroft Road, Welwyn Garden City, to form a new club known as The Welwyn Garden City Photo-

graphic Society. The Society is intending to seek affiliation to the East Anglian Federation, and meetings will be held on Wednesday evenings throughout the winter. Mr. Hart will be glad to hear from intending members if they will write to him at the above address.

The King's Heath and District Photographic Society inform us that their membership during the past twelve months has shown a steady increase, but they are still anxious to admit new members, especially beginners, who will be welcomed and assisted by the more advanced workers of the Club. The Hon. Secretary is Mr. L. P. Lowenthal, Wayside, 37, Hazelhurst Road, King's Heath, Birmingham, 14, to whom all communications should be addressed.

Those who like to keep their photographs within easy reach will be interested in the Ensign Library Albums and Book Boxes, which are finished to look like ordinary books and can be placed inconspicuously among them on any bookshelf. The albums are made in both slip-in and paste-on types, the former being for $3\frac{1}{2} \times 2\frac{1}{2}$ prints only. It holds 100 prints, two on a page, and costs 2s. 6d. Paste-on albums of 72 pages cost 3s. 6d. in 7×5 in. size and 5s. 6d. in $9\frac{1}{2} \times 7$ in. size. The Book Boxes are meant for storing loose prints,

mounted or unmounted, and each will hold a hundred photographs. Sizes run from $3\frac{1}{2} \times 2\frac{1}{2}$ to whole-plate, the prices ranging from 1s. to 1s. 9d. and this method of keeping prints is especially suitable for enlargements. In addition to these novelties, the Ensign catalogue of albums contains descriptions and illustrations of more conventional albums in all sizes and types, including the Glenjo slip-in album, in which the prints are held in a new and very convenient way. A copy of this catalogue will be sent post free on application to Messrs. Ensign Ltd., 88-89, High Holborn, London, W.C.1.

An Empire Wild Life Photographic Competition is being organised by the Field as part of the Sporting Exhibition at the Imperial Institute to be held in January, 1938. Entries should reach the "Field House," Bream's Buildings, Chancery Lane, W.C.2, by the 1st of January, 1938, and should be marked "Empire Photographic Competition." Copies of the rules and conditions of entry are now available from the above address, or we have a limited supply at these offices which we shall be pleased to send readers upon application.

Mr. Fritz Borst, Schönbach b. Eger, Czechoslovakia, has again been successful in winning the Wallace Heaton weekly award of one guinea. His print "Fly bird, fly!" was adjudged the prize winner in the first of the "Speed and Action" competitions, full particulars of which will be found in the advertisement pages in this issue.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5×3 , supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

104. Makers' Formulæ: Developers for Barnet Lantern Plates—(2)

For Lantern Transparency Plates.

Cold Black Tones.

A. Metol	100 grs.	(11 grm.)
Sodium sulphite (anhydrous)	440 grs.	(50 grm.)
Water to	20 oz.	(1,000 c.c.)
B. Potassium carbonate	300 grs.	(34 grm.)
Ammonium bromide	60 grs.	(6.8 grm.)
Potassium bromide	120 grs.	(13.6 grm.)
Water to	20 oz.	(1,000 c.c.)

Take double above amount of sulphite if crystals are used.

For use, take equal parts of A and B and develop for 2 minutes at 65° Fahr. (18° C.).

Warm Black Tones.

A. Hydroquinone	160 grs.	(18 grm.)
Sodium sulphite (anhydrous)	440 grs.	(50 grm.)
Potassium bromide	30 grs.	(3.4 grm.)
Citric acid	60 grs.	(6.8 grm.)
Water to	20 oz.	(1,000 c.c.)
B. Caustic soda	160 grs.	(18 grm.)
Water to	20 oz.	(1,000 c.c.)

Take double above amount of sulphite if crystals are used.

Use equal parts of A and B, and develop at

65° Fahr. (18° C.) for 2 minutes. No increase in exposure is required.

Warm Brown Tones.

A. Pyrogallol	110 grs.	(12.5 grm.)
Sodium sulphite (anhydrous)	220 grs.	(25 grm.)
Water to	20 oz.	(1,000 c.c.)
B. Ammonium carbonate	220 grs.	(25 grm.)
Caustic potash	190 grs.	(21.5 grm.)
Ammonium bromide	150 grs.	(17 grm.)
Water to	20 oz.	(1,000 c.c.)

If crystallised sulphite is preferred, take double amount shown.

Increase exposure about 15 times, and develop at 65° Fahr. (18° C.) for 2 minutes in a mixture of equal parts of A and B.

Alternatively, develop for 3 to 4 minutes in the "warm black" developer to each ounce (50 c.c.) of which is added 3 grs. (0.25 grm.) each of ammonium carbonate and ammonium bromide.

Very Warm Tones.

Increase exposure to about 30 times normal and develop for about 8 minutes in the "warm black" developer to each ounce (50 c.c.) of which is added 6 grs. (0.5 grm.) each of ammonium carbonate and ammonium bromide.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Welta Cameras.

I have a Welta camera fitted with a Welta lens. This (the lens) has been damaged, and I should like to know where to apply to have it repaired and readjusted. J. L. N. (Bristol.)

The British agents for the Welta cameras are Messrs. Peeling & Van Neck, of 4-6, Holborn Circus, E.C.1, to whom you should apply for a repair or replacement to your lens.

No Electricity or Gas.

I have neither electricity nor gas in the house, but wish to make enlargements from my 6x9 cm. negatives. Is an enlarger made for illuminants of any other kind? V. S. (Aberdeen.)

We do not know of any enlargers using illuminants other than gas or electricity, except some of the older type of horizontal enlargers, which in many cases have a roomy lamp-house that will take any type of illuminant. This type of enlarger is manufactured by Messrs. J. Lancaster & Son, Ltd., 54, Irving Street, Birmingham, 15, in the 3½x2½ size, but so far as we know no other manufacturer of horizontal enlargers makes a model smaller than quarter-plate size.

Developing Pan. Film.

I wish to buy a developing tank for V.P. film; could you please tell me which make I should get? And as I use panchromatic film, should I desensitise it before development? And would this coarsen the grain? B. B. L. (Devonport.)

We published particulars of the various tanks suitable for amateurs in our issue of June 2nd last, to which we would refer you for details of the tanks available. With these details before you we think you will be able to make your own choice.

If you develop panchromatic film in a tank there is no purpose whatever in desensitising it first. Desensitising is used to enable film to be developed by inspection in any suitable safe-light. We have no reason to sup-

pose that desensitising has any effect whatever on the grain.

Protection.

I am making myself a developing tank of wood, and should be glad to know how I can treat it so as to prevent the various solutions from soaking into the wood and disintegrating it. B. S. S. (Northampton.)

You can render the wood of your tank impervious to photographic solutions by painting it with anti-sulphuric enamel, which can be obtained from Messrs. Griffiths Bros. & Co. (London), Ltd., Macks Road, Bermondsey, S.E.14.

Instructions for Use.

I have an old Kodak roll-film tank, of a pattern which you can perhaps identify from the attached sketch. I have no idea how to use it, and should be glad if you could give me full instructions. E. W. H. (Newcastle.)

We have seen the tank you describe, but not for some years, and we could certainly not undertake to evolve from memory reliable working instructions for it. Much your best plan would be to send your query and sketch direct to Messrs. Kodak, and ask them if they can supply you with a copy of the instructions which originally accompanied the tank.

Home-made Ciné Screen.

Some time ago there was an article in "The A.P." on making a roll-up ciné projection screen with a beaded surface. Could you let me know when this article appeared as I have been unable to trace it? A. T. (Luton.)

We think the article to which you refer was that published in our issue for November 11th, 1936, on page 497. This describes the manufacture of a screen with a beaded glass surface, but it is of a rigid pattern, and not of the roll-up type. We regret that we cannot trace any article dealing with a roll-up screen with beaded surface, and do not remember such ever having been published.

Filter Factors and Speed.

Does the factor of a filter depend on the speed of the film with which it is used? Or is the factor always the same for any film? J. D. S. (Northwood.)

The factor of a filter varies according to the character of the emulsion and the light by which the photograph is taken, and what the factor is with a particular film must be found by experiment. It does not necessarily have anything to do with the mere speed of the film, but with its sensitiveness to different colours. As most of the fastest panchromatic films are more sensitive to red than the slower ones, the factor of a yellow filter is, however, generally less with the faster films.

Warm and Cold Tones.

Photographic books and magazines frequently refer to "warm" or "cold" blacks. What exactly do these terms imply? R. D. L. (Cambridge.)

In the case you mention a black is colder as it approaches a blue tinge, and warmer as it assumes a brownish tone. The term "brown-black" is used to imply a shade even more brownish than warm black.

Meters and Artificial Light.

I have been using an extinction meter for outdoor subjects with quite reasonably good success. If I use it for artificial light, will any correcting factor be required, and if so, can you tell me what it should be? And what, please, is "half-watt lighting"? W. D. C. (London.)

In using an extinction type exposure meter by artificial light allowance has to be made for the fact that the sensitivity of the eye in dim lighting is very high, and the meter, as normally used, will indicate exposures which are decidedly too short. As the adjustment of sensitivity of the eye depends on the brilliance of the light, it is almost impossible to give any figures by which to multiply the reading of the meter, but we suggest as a first trial that you give ten times the reading that the meter indicates.

Half-watt lighting is lighting by ordinary gas-filled electric lamps, which are known also as half-watt lamps on the grounds that they give approximately one candle-power for each half watt of electrical power consumed.

Colour Correction in Lenses.

In a catalogue describing lenses it says that one particular anastigmat lens is only fully corrected for colour at apertures of f/6.3 or smaller. How will the lack of correction affect the definition at the larger stops? R. N. P. W. (Scunthorpe.)

If a lens is incompletely corrected for colour it will bring images taken by white (many-coloured) light to a focus in a series of adjacent planes, one for each colour. In any one position of the sensitive surface only one of these colours can give a sharp image, and this will be surrounded by the blurred images in other colours. Sharp pictures can therefore only be obtained by photographing by monochromatic light, or by using a non-colour-sensitive material which is sensitive only to a narrow band of the spectrum. But in the case you mention we should expect the deviation from perfection to be quite trifling.

CONFISCATED CAMERAS

The following brand new cameras were recently seized by H.M. Customs

We have been able to purchase them from the Commissioners of Customs and Excise at favourable rates, and are happy to pass on our good fortune to our customer friends. It should be remembered that these cameras are in every way brand new, and the reduction in prices is due solely to the advantageous terms of our purchase. Our usual guarantee accompanies each camera, and those interested are urged not to delay in applying, as the demand will very soon exceed the supply.

Leica III, chromium, fitted f 2 Summar lens, in E.R. case.....	£33 15 0
Leica III, chromium, fitted f 3.5 Elmar, E.R. case.....	£26 10 0
Leica IIIa, fitted f 2 Summar lens, with E.R. case.....	£37 10 0
Contax II, f 2 Sonnar lens, ever-ready case.....	£43 10 0
Super Ikonta 531 2, ever-ready case.....	£22 10 0
Leica III, f 3.5 Elmar, E.R. case.....	£28 17 6

STOCKS WERE TOO HEAVY

of the following cameras, and the manufacturers decided, therefore, to reduce their stocks, by drastic measures if need be, to release capital for the production of other apparatus. Those measures have been taken, and we are now able to offer the surplus stocks at the reduced prices shown below.

Each camera is complete in its box, with instructions for use, and they are all covered by our own dependable guarantee.

THE WELTINI

The attractive points about the Welmini are the combined view and range finders, the conveniently situated body release, worm action focussing, automatic withdrawal of the focus to infinity, and its special film pressure plate. The camera presents a very attractive appearance, being dull chromium plated, and is in every way a most dependable and useful camera. The negative size is the standard 35-mm. and all daylight-loading patroness may be used.

The prices of the Welmini, all fitted with the Compur Rapid shutter, giving speeds from 1 second to 1/500th second, are as follows: the first price is the actual list price, and the second is the one at which we are offering the cameras for sale.

Welmini with f 2.8 Xenar, £22 10s.	
reduced to £16 17 6	
Welmini with f 2.8 Tessar, £25 10s.	
reduced to £18 17 6	
Welmini with f 2 Xenon, £27	
reduced to £20 10 0	

THE WELTI

This camera has no coupled range-finder, although a shoe is fitted to permit of the use of a separate range-finder. A direct-vision view-finder is fitted with a body release conveniently situated for fast work. The same excellent worm action focussing is used as on the Welmini, and the same negative size (35-mm.) is also used. The film counter is accurate, and the strutting of the camera ensures perfect rigidity.

The prices of the Welmini cameras offered are as follows:—

Welmini fitted f 2.8 Xenar	Makers' prices £14 0 0.	Our prices	£9 17 6
Welmini fitted f 2.8 Tessar	" " £16 5 0	" "	£12 17 6
Welmini fitted f 2 Xenon	" " £17 17 6	" "	£13 15 0

THE WELTUR

The Weltur is really a larger negative size version of the Welmini, as it embodies all of the Welmini's attractive features, having, in addition, the advantage of a delayed-action Compur shutter. Pan windows are fitted, and the other points—coupled view cum range-finder, body release, chromium plating, and worm focussing are exactly the same in both models. The Weltur takes 16 pictures on the standard 3½×2½ roll.

These cameras are now offered at the following prices:—

Weltur, fitted f 2.8 Xenar and Compur Rapid shutter.	Makers' price £21 13s. 6d.	Our price	£16 7 6
Weltur, fitted f 2.8 Tessar and Compur Normal.	Makers' price £24 12s. 6d.	Our price	£17 17 6

SUPER BALDINA

The main points about the Super Baldina, which takes the standard 36-exposure 35-mm. daylight loading patroness are:—

- 1.—The automatic counting and film locking device, which operates after each exposure.
- 2.—The tubular view-finder which, connected to the focussing mechanism, automatically corrects the parallax error between the fields covered by the finder lens and the taking lens.
- 3.—The accurate coupled range-finder.

The camera has an all-metal body, leather covered, and all external metal parts are nickel plated. The sizes are 5×3½×1½ in., and the weight 17 oz.

The prices of the Super Baldina cameras are as follows:—

Super Baldina, fitted f 2.9 Trioplan.	List price £13 5s.	Our price.....	£9 17 6
Super Baldina, fitted f 2.8 Tessar.	List price £18 10s.	Our price.....	£13 10 0
Super Baldina, fitted f 2 Xenon, Rapid Compur.	List price £19 19s.	Our price	£15 15 0

BALDAXETTES I and II

The Baldaxette I takes 16 pictures on the standard 3½×2½ film. It has a coupled range-finder, automatic parallax compensation, brilliant optical finder compensated for parallax, automatic film transport, and a helical lens mount which permits of very smooth focussing. The Baldaxette II takes 12 pictures 2½ in. square instead of 16. Briefly, the Baldaxette is to the Super Baldina what the Weltur is to the Welmini.

The prices of the Baldaxettes, both Models I and II, are given below. Baldaxette I or II, fitted f 2.9 Trioplan and delayed-action Compur Normal shutter. Makers' price £18 5s.

Our price £12 10 0

THE BALDAX

This camera takes the standard 3½×2½ roll film, and gives 16 pictures 1½×2½ in. It has a self-erecting front, optical view-finder, well-designed struts for rigidity. The Prontor II shutter gives speeds of 1 to 1/175th second, with delayed-action release. The camera is of all-metal construction, leather covered, and all external parts nickel plated.

The price of the Baldax, fitted with f 4.5 Trioplan lens in Prontor II shutter, is usually £6 2s. 6d., but we are able to offer the camera now at.....£4 10 0

Every keen Camera User should be sure to get

The AMATEUR PHOTOGRAPHER

DIARY and Handbook for 1938

This useful little handbook contains in addition to the usual diary pages—one week to the page—over fifty pages of facts and formulae for the keen camera user. Information is given on developing, fixing baths, mountants, and finishing negatives and prints. Numerous reference tables dealing with hyperfocal distances, enlarging, screen distances for lantern projection and exposures are included, as well as sections for exposure records and personal memoranda.

Size $3\frac{1}{2} \times 5\frac{1}{2}$ inches, well printed, neatly and strongly bound in leather cloth, with back loop pencil and round corners.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 16%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's mistakes, although every care is taken to avoid minor errors.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **LIFE & SONS LTD.**, and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CAMERAS AND LENSES

Illustration shows G.3 fitted with gear-driven arms to take 800-ft. reels, which are now available.

nailland

BOLEX

1938 IMPROVEMENTS
Without any increase in price.

INTERCHANGEABLE CONDENSERS
for 8-mm. FILM.

This latest refinement is fitted to the Model G.3 showing 8, 9.5 and 16 mm. films and the G.816 for 8 and 16 mm. films and makes available the same power of illumination for 8-mm. as for 16-mm. films.

The two condensers are mounted on a metal plate which slides into guides. The action of sliding out and reversing the plate to bring the appropriate condenser into position automatically centres the lamp for the condenser in use.

CHOICE OF 2 or 4 BLADE SHUTTER at the turn of a knob.

This latest refinement to all type "G" projectors brings something quite new in projection technique—the tremendous advantage of using the four-blade shutter and being able to show your films in the home at speeds below normal without noticeable flicker, or, by turning a knob, to change over to the two-blade shutter for use in halls, etc.

With the four-blade shutter you can project to as slow a speed as 12 pictures per second and get 25% longer, showing from your films without any obvious slowing up of motion. For use in halls where screens up to 16 ft. wide are required, a turn of the knob changes over to two-blade projection, giving a 50% increase in screen brilliance.

The turn of a knob changes from 2 to 4 blade projection.

Model G.916, for 9.5 and 16 mm. films, with resistance and 500-watt lamp. £45 0 0
Other models from. £29 17 6

Why not get a home ciné projector on easy payments spread over one or two years? Confidential, no harsh enquiries, anything taken in exchange. Wallace Heaton Ltd. or City Sale and Exchange (1929) Ltd.

" MISCELLANEOUS "**Our New Enlarger**

SPECIFICATION.—British-made Vertical enlarger, with 40-in. steel column upon which the lamphouse slides very smoothly, being held rigid in any desired position by a simple locking device. The column is firmly bolted to a large baseboard (19x17 in.) which is doubly strengthened with cross-battens. The all-metal lamphouse is of double construction and well ventilated, and is fitted with two 4-in. Plano-Convex condenser lenses which ensure even illumination, provided by a 100-watt opal lamp. A mahogany negative carrier is supplied to take negatives of all sizes (glass or film) up to 3 1/2 x 2 1/2 in. The standard lens fitted is the Ludwig "Victor" 4-in. f/4.5 with iris diaphragm, fine focussing being effected by a smoothly working spiral. From a 2 1/2 x 2 1/2 negative any size enlargement can be made from about postcard size to 19 x 14 in., etc. The whole instrument is well finished in black and nickel, with a ruled white sheet on the backboard and two yards of flex with bayonet plug. The needle-sharp definition of the Victor lens ensures perfect reproduction, even at the greatest degree of enlargement.

Price, with Ludwig Victor f/4.5 lens, with iris..... £5 12 6
Price, with Optis f/4.5 lens, without iris..... £5 5 0
Price, without lens..... £4 0 0
Lamp extra, 2/9.

Packed F.O.R. London. Please state voltage when ordering.

**NEW ENLARGING ANASTIGMAT LENSES**

We have purchased a large stock of brand new "VICTOR" anastigmat lenses by Messrs. Ludwig of Dresden. These lenses are all in normal iris mounts as illustrated. The iris leaves are metal. The "stops" are marked down to f/16. Each lens mount is finished in black enamel, and is fitted with detachable flange. These lenses were designed for enlarging purposes, and we have tested and can recommend them.

Brighter Photography

By DAVID CHARLES, F.R.P.S.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. There are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing, and over one hundred and sixty illustrations, each numbered and each conveying a really useful hint.

GIFT SUGGESTIONS ON OUR 2-YEAR TERMS

Now is the time to buy for Christmas—just in time to get your purchase on our confidential payment plan. There's no big outlay to make—you can take possession of your purchase soon after paying the first of 24, 15 or 9 monthly payments, according to the cash price of the article. Write to us now, or, better still, come and browse around our showrooms and see the marvellous array of still and cine apparatus. An expert will give you sound advice on your choice from the particular class of apparatus you have in mind. Act at once and avoid disappointing yourself or any relative or friend.

YOU'LL PLEASE THE WHOLE FAMILY WITH TALKIES OR MOVIES FOR CHRISTMAS!

PICTURE MAKING AT HOME...

Photograph on Selo Hypersensitive Panchromatic Roll Film. Exposure: $\frac{1}{25}$ sec. at F15.6, with 2 Selo Lighting Sets at 3 feet from the subject

Something *different* for you to do these long dark evenings—the fascinating hobby of night photography. With the wonderful speed of Selo Hypersensitive Panchromatic Roll Film and Ilford Hypersensitive Panchromatic Plates it's just as simple as picture making by day. Round your own home a host of opportunities awaits you—the family and your friends, social gatherings that you will be glad to look back on. So don't let dust settle on your camera now that winter is here!

THE SEASON'S 'LUCKY DIP'

3 Fast-lens Cameras for Winter Photography.

Here are some winter weapons of *calibre*!—the Six-20 'Kodak' B, the Six-20 Duo 'Kodak,' the 'Retina'. As Christmas presents they will bring joy to the heart of the keen photographer, both to give and to receive. For winter photography indoors or out, they fill the bill to the 'brim'!

Modern edition of a famous forerunner, the Six-20 'Kodak' B is refined in all its details: built-in piston release on body of camera, folding optical viewfinder, quick-action opening and closing mechanism, and superb *finish*. There are lens and shutter combinations to suit all pockets, from *f*6.3 and 3-speed shutter at £4.7.6 to *f*4.5 and 'Compur' (with delayed action) at £7.15.0.

As elegant as it is efficient, the new chromium model Six-20 Duo 'Kodak' is the camera

for the photographer who wants extreme compactness, precision and speed. It has a Kodak *f*4.5 or *f*3.5 or Zeiss *f*3.5 lens, a 4-speed Kodak or 8-speed 'Compur' shutter, and takes 16 pictures, 2 $\frac{1}{4}$ " x 1 $\frac{5}{8}$ ", on a 620 spool. It has built-in piston release, folding optical viewfinder, depth-of-focus scale, an attachment for the Kodak Pocket Rangefinder. You can get it from £7.10.0 to £13.10.0 according to choice of equipment.

The 'Retina'—famous low-priced precision miniature—takes you all the way from 'pan.' to full-colour 'Kodachrome.' Kodak, Schneider or Zeiss *f*3.5 lens, 'Compur' or 'Compur-Rapid' shutter, automatic exposure counter, optical 'spy-glass' viewfinder—these are among the attractive features of the 'Retina's' equipment. The price is £10.10.0 to £15.0.0.

Take your choice—they are all 'in season'!

Your old friend, MR. CLICK, the A.C.S. Camera Man, and symbol of our cheerful Personal Service, sends a special Xmas greeting to all friends (and we hope we may call all our customers' friends) who have said such nice things about him, and his adoption as our mascot to indicate to you the very real and personal interest we all take in all customers' needs and problems, and the cheerful ungrudging manner in which we promptly rectify any little difficulty that you may encounter, some of which are inevitable occasionally, no matter how carefully guarded against.

Edson

MR. CLICK AND HIS MERRY MEN—

at A.C.S., Ltd., wish you all a very jolly Christmas, and extend our warm greetings to all who have contributed to our successful season.

We have all enjoyed being of service to you, and from the many testimonials we receive from time to time, with but very rare criticisms, we are confident we can sit down to our Christmas dinner secure in the knowledge that we have given you all a square deal.

It is now so near Xmas, with its period of rapidly changing stocks, that we are only offering you a short selection of special bargains, although we have an excellent range of both new and reconditioned Minicameras, Ciné Cameras and Projectors to suit all requirements and we hope you will look up, phone or write whichever branch you find most convenient if you are seeking any fresh equipment. Don't forget we carry a wide range of photographic and ciné accessories, ideal for that last-minute Christmas present. Every approval facility is offered, and we carry our own Easy Payment system, and can thus make arrangements to suit your convenience, if you do not wish to make the full outlay at once.

AMATEUR CINE SERVICE LTD.

52-4 WIDMORE RD., BROMLEY, KENT - RAVENSBORNE 0156-7

6 GRAYS INN RD., LONDON, W.C.1 - HOLBORN 9894-5

THE VERY THING for XMAS

- Tells you at a glance the correct aperture and shutter speed at actual moment of exposure.
- Simplest Photo-Electric exposure meter on the market. Method of exposure indication is unique.
- Highly Sensitive. Indicates exposures from 60 secs. to 1/2,000th of a sec.
- A precision instrument. Influenced only by light received by camera.
- Size only 2½ x 2½ x 1 in. Can be held and operated in one hand.

For Still or Ciné Cameras. Made by makers of the renowned "AVO" Precision Electrical Measuring Instruments.

63/-

Ever-ready case, as illustrated 5/- extra.

*Every keen Camera User should
be sure to get*

The AMATEUR PHOTOGRAPHER DIARY

and Handbook for 1938

This useful little handbook contains in addition to the usual diary pages—one week to the page—over fifty pages of facts and formulae for the keen camera user. Information is given on developing, fixing baths, mountants, and finishing negatives and prints. Numerous reference tables dealing with hyperfocal distances, enlarging, screen distances for lantern projection and exposures are included, as well as sections for exposure records and personal memoranda.

Size 3½ x 5½ inches, well printed, neatly and strongly bound in leather cloth, with back loop pencil and round corners.

AT CHRISTMAS & ALL TIMES

Rolleicord

will make PERFECT PICTURES

GIVE A ROLLEICORD FOR CHRISTMAS—

it's the greatest camera value on the market.

This fine camera has won popularity throughout the ranks of amateur photographers. It is so easy to use, it shows the picture full size and right way up on the ground-glass screen, and composing and focussing are quite simple. Rolleicord takes 12 square pictures $2\frac{1}{2} \times 2\frac{1}{2}$ " on ordinary standard roll film for 1/-, and can also be adapted for plates and 35-mm. miniature film. It takes all Rolleiflex accessories except the angle mirror. There are two Rolleicord models—both fitted with Compur shutter speeded to 1/300th sec., T. and B. The Model Ia (as illustrated) has f/4.5 Zeiss Triotar lens, and costs only... **£12:10:0**

ROLLEICORD MODEL II. With all the fine features of Model Ia, but is fitted with f/3.5 Zeiss Triotar lens... **£16:10:0**

See it at your dealer's now and be in time for Christmas.

HERE'S A GIFT ANY SERIOUS WORKER WOULD WELCOME...

The meter that gives accurate exposure readings even in the darkest interiors.

TEMPIPHOT

Photo-Electric Exposure Meter and AMPLIFYING ELEMENT

Photography in artificial light presents no difficulties when you own a Tempiphot. It is the only meter with an amplifier which increases the range of readings for recording artificial light exposures. There are no calculations to make. Readings for strong, poor, or artificial light are all contained on a single scale. Readings up to 120 seconds at f/9 with a film of 23° Scheiner can be instantly obtained. The Tempiphot can be used with or without amplifier. The amplifier simply plugs in when required, but the meter itself is the finest you can possibly use under ordinary conditions.

TEMPIPHOT costs £4:0:0

Amplifier, 37/6. Leather Zip Cases, 5/- each.

Be sure to write for detailed prospectus of "Rolleicord" and "Tempiphot" from

"I LOVE LITTLE PUSSY,"

Her coat is so warm, And if I just stroke her, She'll do me no harm!" We can just imagine some of our customers as they must have been long years ago, standing in their velvet suits before all the gathered family and bravely saying their "piece" at the Christmas party!

And now they themselves are the givers of the feasts: their children are now expected to "say some poetry." But how times change! The children now turn for their inspiration to the poet who writes in mauve ink on red-bordered green paper—"so crashingly different, don't you think?"

But what about Papa? Has he changed, too? Is his change for the better? Answers being, "Well, what?" "Ask Mama!" and "Who cares?" Seriously, though, he is materially different in this; that the records of his Christmas parties are not to be found in his diary but in his photograph album—thanks to the miniature, which has made the change possible.

And as he is really pleased both with his camera and with the firm from which it came, you can see why he considers it a very good plan to "Try 202 for Service."

"Freddie" Sandell, upon whose wide experience and excellent service R. G. Lewis (Ciné) has been built, has deservedly captured the greater part of the London-bound ciné business. In their sphere his ciné staff are as able as the miniaturists at "202"; in fact, his first mate, Mr. V. T. Wood, is our conception of the perfect salesman—quiet, courteous, knowledgeable, and dependable. The service that they offer is only equalled by our own. Enough said!

We apologise, Mr. Miniaturist, for filching your space this week, but we know you will not object to our having done so on this occasion, especially as the subject matter may prove of interest to your ciné friend. We "202" miniaturists don't touch the ciné stuff—we believe that miniature and cinema photography are both progressing so quickly that it is impossible to specialise in both, which explains why it is such a good plan to "Try 202 for Service!"

MINIATURE NEWS AND TIPS DEPARTMENT

TIP OF THE WEEK.—It is surprising that so many Leica and Exakta users do not know how to make double exposures with their apparatus. Often the shutter is fired with the lens cap on, and they cheerfully abandon that frame, not knowing that it can still be used. Trick photography is often not attempted for the same reason. With the Leica the shutter can be wound and reset by depressing the release button and turning the shutter-setting knob in anti-clockwise direction as far as it will go. The release button is then allowed to rise, and the shutter speed altered (if desired). The shutter is then once again ready to open across the same frame. When using the Exakta, exactly the same operation should be carried out, but in this case the release button need not be depressed.

THIS WEEK'S NEWS—Is that there is no news of importance, so we would like to set at rest the doubts existent in many miniaturists' minds as to the origin of the Leitz f/1.5 Xenon. This lens, although bearing the name of "Xenon" usually associated with lenses of another make, is entirely computed and made by Leitz. The name of "Xenon" is used as it contains certain features of the respective Schneider lens and it is also covered by a patent of Messrs. Taylor, Taylor and Hobson, besides one by Leitz themselves. Nevertheless, as pointed out before, it is entirely computed and made by Leitz themselves. Incidentally, we recently referred to the "Schneider Xenon for the Leica"; we meant, of course, the Leitz Xenon.

"AND THE LITTLE DOG LAUGHED!"

Come with us behind the scenes and see the progress of Champlin 15 as we have seen it.

Many months ago we introduced our first concentrated solution. Not too good an effort. A month later we reaped the benefit of our experience, and improved the solution considerably. The demand grew enormously. Then price-cutting started. The extra degree of refinement for our chemicals; the scrupulous and painstaking care in preparation; our avoidance of "bulk" orders to ensure constant freshness, these put us at a disadvantage. Others were able to "slice" us. Two quiet months. Not a single advertisement by us of our solution. We knew what was happening. We let it happen.

To-day the miniaturist obviously considers that there is only one Champlin 15 preparation worth talking about. In the first place he tried ours. Next he tried an inferior make-up. Now he's back at "202" again. There's no doubt about it—the serious miniaturist is not the man to risk five precious films for the sake of a few pence extra for his developer.

(Champlin 15 from us costs 4/9 per bottle sufficient for developing five normally exposed films, Leica size. The postage is 6d.)

HONOUR OR UNWISDOM?

Many men seem to think it a matter of personal honour to refrain even from contracting financial ties. They will not amend their ideas even if the payment in full for their requirements gives their bank managers sadly to shake their heads.

Honour? Maybe! But the modern man would call it unwisdom. Keep your balance healthy; who knows what demands you may have upon your resources to-morrow? If, however, you are satisfied that you can safely pay cash, do so by all means, but don't strain the ancestral purse unnecessarily when our hire purchase arrangements are so convenient and tactful.

BEST WISHES TO YOU AND YOURS, MR. MINIATURIST.

MAY CHRISTMAS 1937 BRING
YOU ALL YOU WISH YOURSELF.

START 1938 WELL!

with a Leitz f/1.5 5-cm. Xenon lens on your Leica, by sending us your present Summar in part exchange. Our allowance on your lens will surprise you—pleasant surprise, of course, Mr. Schnitzelbaum! Christmas buying has left you somewhat "short." Don't worry. The balance can be spread over hire purchase, with two years to pay if desired.

LEICAS:

Leica III, f/1.5 Plasmal, coupled. Excellent condition £37 17 6

VOL. LXXXIV. No. 2563.

CHRISTMAS-TIME! Time of parties, festivities, presents, exciting conspiracies, family reunions, and general jollification. What chances for the camera! Chances, alas! of which advantage is all too seldom taken. The amateur may rack his brains to compose ingenious pictures on holiday, or make attractive "snaps" of all the happy children he can find, in the search for the gaiety of the holiday spirit, yet photographically Christmas, which is a very "high spot" of picture-making possibilities, is frequently treated in a very casual manner or overlooked altogether by the photographer. Modern film speeds have brought indoor work within the reach of the most modest camera users, a fact that does not generally seem to be realised. It is not always necessary to have an f/1.9 lens to depict interiors. The tyro with a small-aperture lens and a Photoflood lamp can, with a little ingenuity, get pictures regarded as unobtainable only a few years ago. We hope that the articles on the subject in this and the preceding two or three issues of "The A.P." will help many of our readers to secure a good bag of indoor pictures this Christmas.

Humour in Photography.

We hear that the Pictorial Group of the R.P.S. is thinking of staging an exhibition of humorous photographs. It will have to be very carefully done, and we should not be surprised if they lost heart in the middle of it. For they must not be merely comic photographs, which would be easy enough to procure. They must be photographs which will suggest something of that delicate and elusive spirit which shines in the work of some of

TOPICS of the Week

The Editor

Happy Christmas
and a
Prosperous
New Year.

our great artists with the pencil. Mr. G. Crosby, who lectured on the subject before the Group, said that he had gone out with the camera in search of humorous photographs, but he had been distressingly unsuccessful. We are not surprised, for humour comes not by searching. It bubbles up unexpectedly from a concealed well. A good many of the examples which Mr. Crosby and others brought forward we should not describe as humorous; some of them were funny or grotesque; others depended for any humour upon their caption, as do many of the drawings in *Punch*, and there the humour surely belongs not to the picture but to the words. The truth may be, as someone said in the discussion, that humour is an escape from reality, and therefore the straight convincing photograph is the worst possible medium for a humorous effect, because it is reality itself.

Fakes.

Rather cruelly and without complete justification, the word "fake" has attached itself to photography. It can be used of other things, various works of art, for example, but the first thing that people think of when the word "fake" is mentioned is some kind of photographic manipulation to "make what isn't appear to be what is." It must be admitted, of course, that photographic faking is extremely easy; that is an inevitable result of the facility of the photographic process which in other connections brings about so much benefit. Nor can it be said that there is a rigid line which divides the justifiable from the unjustifiable in faking. There are some people who would exclaim against putting

clouds into landscapes to which they did not originally belong; yet no one is hurt by such deception. An area of work in which faking is really to be deplored, however, is in photographs which are put forward as news. It is as wrong to fake a news photograph as it would be to alter the evidence of a witness given in court, and there ought to be some protection for the public in this respect. A new form of faking, which suggests vast possibilities for evil, has just been brought to our notice by an English friend in Germany. He went to a picture house where the news-reel contained a picture of some mob disturbances in London streets. No fault could be found with the picture, which was authentic enough, but the sound effects had been tampered with, and during the scuffle the rattle of machine-gun fire was clearly heard. Machine guns have certainly never been operated against rioters in the streets of London. The faking of sound effects to accompany a film which in itself is a faithful record of what occurred is a contingency which has to be borne in mind.

On the Track of Sensations.

The press photographer in this country is second to none in keenness and as quick as any in being on the spot, but the character of his jobs—or, more elegantly put, his assignments—differs somewhat from that of his American colleague. The American press photographer, to judge from a book recently published in the States, is chiefly on the track of "battles, murders, and sudden death." One gathers, from the relative space allotted to the subject, and from the specimen illustrations, that half his time is devoted to homicides, kidnappings, railway accidents, fires, explosions, and aeroplane crashes. To these subjects he gives twice as much attention as to sport. The British press photographer, on the other hand, while fully alive to the news value of these things, has always in mind the never-failing British interest in sport. He has also another subject of never-failing interest which the American photographer lacks altogether—doesn't the American wish he had it!—namely, the Royal Family.

Photography at the Circus.

For the benefit of those readers who did not see our announcement in "The A.P." Christmas Number we are repeating here that photography at the Circus at Olympia is now permitted at all performances. A Cash Prize Competition has been arranged by the management, with prizes of £5 5s., £3 3s. and three of £1 1s. for photographs taken by amateurs at this season's show. These prizes will be doubled if the competitors are readers of *The Amateur Photographer* and coupons from current issues are affixed to the backs of the prints. The Circus opens to-day (December 22nd) and the competition closes on January 22nd. As the entries will probably be enlargements from small negatives, $8\frac{1}{2} \times 6\frac{1}{2}$ (whole-plate) has been decided upon as the minimum size for prints. Full details of camera, film, stop, exposure, etc., and date of performance should be given. All prints to be sent to the Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1, marked clearly on the outside of the envelope, "Circus."

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Shellac Mounting.

I have tried mounting my prints with shellac instead of paste, but have difficulty in getting them to stick flat all over. Can you give me some hints to put me on the right track? P. H. F. (Didcot.)

We presume you are brushing the shellac over the back of the print and applying it to the mount at once, and as the solution takes some time to adhere and set you find it a slow job. We suggest that you try the following method which is a modification of dry-mounting with tissue.

Get some good quality orange or bleached shellac and put 4 oz. in a wide-mouthed stoppered bottle. Pour on 5 oz. of methylated spirit, and stand aside for twenty-four hours, giving it an occasional stir or shake-up. The whole of the shellac will dissolve, making a gummy solution which should be filtered through fine muslin.

Brush this well over the backs of the prints with a stiff flat brush, and lay the prints back upwards to dry. This may take about half an hour. Taking the prints in rotation, trim them ready for mounting.

Lay a mount on a smooth pad of sheets of newspaper, about a dozen sheets deep, and heat an iron, electric for preference, to considerably under the temperature used for laundry purposes or ordinary dry-mounting. No exact temperature is required; if it is on the low side it will only involve a longer application to soften the shellac.

Holding the print in position on the mount, put a sheet of clean paper over one end of it and apply the hot iron till this part of the print adheres to the mount. Shift the paper so that it covers the print, and move the iron very slowly over the whole print, working from the middle outwards over the edges. The aim is to heat the whole of the shellac till it is soft

and tacky. When this has been accomplished, lay a sheet of glass or plywood over the print, and weight it down with a heavy book or two till the shellac is cold.

If this is all done correctly the print will be perfectly mounted. Should there be any sign of blisters or loose edges a further application of the iron, followed by pressure, will put matters right. A good substitute for glass or ordinary plywood is Plymax, which is plywood covered on one side with a thin sheet of metal. This is a good pressure board for other purposes also.

Concentrated Developer.

More than once I have tried to concoct a highly concentrated developing solution, but with indifferent results. Can you suggest a reasonably simple one for general purposes?

A. A. N. (Hythe.)

Highly concentrated solutions are by no means easy to prepare, but you should have no difficulty with the following, which is of moderate concentration:

Mitol	30 grs.
Adurol	120 grs.
Sodium sulphite	750 grs.
Potassium carbonate	2 oz.
Water	10 oz.

You may substitute hydroquinone for the adurol, but the latter is preferable for winter work.

For negatives and gaslight paper take from 4 to 6 parts of water to one part of stock solution, and for bromide papers 7 or 8 parts. For warm-tone lantern slides and for chlorobromide papers still further dilution is necessary. Potassium bromide is best added as required from a ten per cent solution.

The Photographic Present

A CHRISTMAS STORY

By L. S. P.

I HAVE a rich uncle. Childless, too, but not so old. Still, in the ordinary course of events it seems likely that he will predecease me and I am his possible heir. Well, you all know what that means—it practically compels one to simulate reasonable intelligence, and also to display some seeming interest in the hobby or life work of the prospective bequeather of riches.

Uncle Edwin has a passion for photography, also real talent for this most difficult art, and one week-end I spent with him I was stupid enough to profess interest in his hobby. The rest of the time was spent in listening to an acknowledged expert in his work endeavouring to give help and assistance to a supposedly keen beginner.

Frantically I withdrew from the position I had assumed—I confessed that my camera experience was *very* limited—that I only had a cheap old model which nevertheless “took lovely pictures.”

This was my undoing. Uncle Edwin is nothing if not generous. His yearly birthday and Christmas cheques are like oases in a desert of poverty. I have learned to rely on them as on some safe and certain bi-annual sop to throw to hungry creditors. Tailors' bills, car licence, holiday money, all become possible with the help of Uncle Edwin.

About a week ago I got a jolt. A heavy and beautifully packed parcel arrived for me, together with a letter from Uncle stating that as he had observed with pleasure my interest in photography, and realised the difficulties of a keen student handicapped by poor equipment, he had on this occasion decided to change the usual cheque for a really good photographic outfit.

I was agast. I had counted on the money and was in the deuce of a hole without it. My birthday was nine months distant, and my bank would look with disfavour on any suggestion to increase my overdraft. Money-lenders? Selling things? *Pawning* things? Borrowing?

I unpacked my parcel thoroughly. The largest box contained what even my untutored eye recognised as an obviously expensive miniature camera of a famous make. Further research

discovered a multitude of gadgets. Light filters (mysterious coloured glass things); a funny little clock thing called an exposure meter; an extraordinarily light and compact tripod of some sort; a huge book on photography, and numerous leaflets of instructions.

The makers' prices were on the instruction books. Whew! Uncle had spread himself to the total of about fifty-six pounds! What a wicked waste, I thought. I thought feverishly of resale—surely a dealer would give me half-price for the lot. Impossible. The letter went on to say how much my Uncle looked forward to seeing my work with this new model.

I began to examine the things more carefully. The camera alone seemed more complicated than any piece of mechanism I had ever handled. Fairly bristling with engraved figures and little wheels and knobs and windows.

I skimmed through the instructions: “Coupled range-finder”—where was it? “Filmcounter,” “depth of focus,” “slow instantaneous exposure,” “interiors.” Me, with my five-shilling box camera, accustomed to wind and “click”!

A couple of hours and I grasped how to fire the thing and had some glimmerings as to the use of the range-finder. The “stops”—a new one to me—and the infinite choice of shutter speeds were beyond me.

I put on my hat and went down to the local chemist. Poor chap, he had

never seen anything like my outfit, and directed me to an expensive-looking camera shop.

I put my cards on the table—or rather all the doings on the counter—and explained the position. They were very helpful and filled the thing for me. Thirty-six shots on one spool instead of eight!

They said that it was a most magnificent outfit, and that I could take anything with it—no need to worry about sun. I asked them to put everything at an average setting suitable for most conditions and this rather stumped them, but they did what they could and I wandered away.

That afternoon I took a nice horse in a field, and nasty child with a dirty face. Also a cloud, as that seemed to be the main use of such a camera, judging by the illustrations in the book.

I met George. He is a fairly keen photographer in a small way, and was visibly impressed. He played about with everything for a bit and then left, obviously envious. His parting words were: “Mind, it’s a devilish expensive job, photography; you’d better give up smoking anyway for a start.” Cheery.

I fiddled about with my gear that night and began to get interested. Some of the photographs in the book were really beautiful. Surely I could learn to do that too—everybody had to start some time.

Next morning an enormous parcel arrived, from the same firm as the camera. I began to feel deranged—this was getting beyond a joke. It contained a huge and awkward thing called the “Blank” Enlarger, and was lavishly finished and obviously of great cost.

Then a letter from Uncle Edwin: “. . . regret the enlarger is a day late, but the firm could not obtain it sooner. It has occurred to me that photography on the scale I hope you will follow is a somewhat expensive hobby if the best results are to be obtained. I therefore enclose a small cheque which may help you to enjoy the best professional assistance until you are capable of producing and finishing your own pictures.”

The cheque was double the usual Christmas one. God bless Uncle Edwin. I’ll be a photographer if it kills me!

Photography

By
H. EMMETT.

"TRY THIS ONE." Taken with all light on and 100-watt lamp. $\frac{1}{2}$ sec. at $f/3.8$.

DURING the Christmas holidays at home every amateur will want to take some photographs as records of the occasion. If he possesses

one or more floodlights he can, of course, take what are literally snapshots provided he uses the fastest panchromatic films or plates and has a lens of fairly large aperture.

If, however, he has no floodlight or flashlight he can still take many Christmas subjects with the ordinary house lighting if the electric bulbs are not covered or otherwise shielded by decorations or coloured shades.

Lamps of 60 and 100 watts are regularly used in most homes and with these available and a camera with $f/4.5$ or even $f/6.3$ lens, together with a tripod and hypersensitive pan. film many good pictures can be secured.

A reading-lamp with a movable shade that can be tilted to act as a reflector, and a long flex with a connection to plug in, will also be very useful for many subjects and act as a spotlight, or

"DRESSING" THE CHRISTMAS TREE.
Taken with ordinary room lighting. 2 secs., $f/4.5$.

The main factor to consider apart from the amount of light available is the distance it is from the subject. If a deliberately posed portrait or group is being attempted and the lights are fixed the subject must be arranged in relation to the light to get the best modelling. For this reason the movable reading-lamp, especially if fitted temporarily with a 100-watt "pearl" bulb, becomes a great asset and can

"WILL HE BE ABLE TO GET DOWN?" 2 secs., $f/4.5$, 100-watt.

INDOORS Christmas

by Ordinary Artificial Light.

SOMETHING ON ACCOUNT.
2 secs., $f/4.5$, ordinary room lighting.

be placed just where it gives the best effect. Take care, however, that none of the lights shines into the lens.

Light walls to the room also assist in keeping the exposures short as they help to reflect a lot of light. If the subject can be depended on not to move during an exposure of 2 to 4 seconds a lens working at an aperture as small as $f/8$ can be used for a subject at a distance of 6 to 8 ft. from the light with only one 100-watt lamp. If this lamp is used in conjunction with several others in the room for general illumination and a larger stop can be employed exposures of one second or less are possible—with hypersensitive pan. film of course.

Taken by the light of one match. 3 secs. at $f/4.5$. Hypersensitive pan. film.

The table of exposures for artificial light given in "The A.P." Christmas Number will be found very useful in this respect, but the amateur who uses the modern fast pan. material with a large lens aperture will be surprised at the number of indoor subjects he can photograph successfully.

By way of experiment a portrait was taken by the light of a match and is reproduced here. This should encourage everyone to try their hand at indoor photography with ordinary artificial light this Christmas. There will be no lack of material for pictures.

DREAMING OF CHRISTMAS. 3 secs., $f/6.3$, ordinary room lighting.

Readers' Hints, Tips and Gadgets

HEATING THE DARK-ROOM.

TO heat a dark-room without having too much "unsafe" light about has always been somewhat of a problem.

Where electricity is available a good heating system can be obtained by using a bowl fire, the bowl facing upwards and being completely covered by a circular tin.

A fairly deep toffee-tin is excellent

for the purpose, but it must be scraped clean of all decoration or the paint will smell abominably when heated. It should be big enough to sit comfortably just inside the rim of the bowl.

A row of holes at the top and bottom will provide enough ventilation, and the fitting of a handle of some material that can be touched when the tin is hot completes the job. **LESLIE SPELLER.**

A THREE-LAMP LIGHTING UNIT.

MANY amateurs must have noticed that the commercial lighting sets have collapsible stands which are not very different in construction from an ordinary music-stand as used by violinists. If a music-stand is available—and a second-hand one can often be picked up for a few shillings—it can quite readily be converted into a stand for three Photoflood lamps.

The lower sketch shows the music-rest open; as all the joints are made by rivets it will fold if the corners G and H are pushed upwards. The conversion is carried out by cutting through strips A C and B D at C and D respectively, as indicated by the dotted lines. For this an ordinary hacksaw is used. The heads of the rivets at A and B are filed away, and the rivets removed; strips A C and B D are then discarded and strips A E and F B swung upwards as indicated by the arrows, bringing the ends A and B together. To these a batten lamp-holder is attached by 4 BA or Meccano bolts as indicated in the upper drawing, the holes from which the rivets have been withdrawn being used.

For the two lower lamps, 4 BA clearance holes are drilled as shown at O, P, Q and R, the spacing of each pair of holes being that required for the lamp-holders, which are used as templates in marking out the positions of the holes.

The three batten holders are then wired to a common plug for connection to the household supply, and three Kodaflectors are fitted, these being held in the usual manner by shade-rings.

Even when fully extended the stand is rather lower than some of those sold for portraiture, but as the majority of indoor portraits and groups consist of sitting figures, this is not so important as it seems. With my own stand the highest bulb is 5 ft. 10 in. from the floor, which is high enough for most purposes, and, after all, the stand can be put on a stool, a chair, or a table if greater height is really essential.

The reflectors mentioned should not be replaced by any of much greater weight, or the stand will not be stable when the bank of lights is swung to point downwards a little; but if made

according to the description given it will be found perfectly steady. A useful point is that provided the reflectors are first removed the complete stand will still fold into a very small compass.

IVOR COTTON.

FRAMING "A.P." PICTURES.

THERE must be many busy folk who, like myself, buy "The A.P." every week and much appreciate the art pages.

I find these much more enjoyable mounted in a black frame in the following simple manner, the chief advantages of which are the ready interchangeability of pictures and its simple construction from cheap materials.

The frame, size 10×13 in., approximately, is constructed very effectively from old gilt lining $\frac{1}{2} \times \frac{1}{2}$ in., or $\frac{1}{4}$ -in. rounded cross-section, blacked with quick-drying enamel.

A sheet of Bristol board is cut to fit frame and an aperture size 6.9×9.2 in.

cut with a sharp knife. (These dimensions allow the title to show). Two strips of paper, of lengths 11 in. and 8 in. and width $1\frac{1}{2}$ in., are folded lengthwise and carefully gummed down to the one side and lower edge of the aperture, so that a corner socket is formed to hold the art page symmetrically.

The back consists of a closely-fitting sheet of card, cut with overall dimensions $\frac{1}{10}$ in. greater than the glass.

Sheet glass, the correct size, if not already in the old frame, may be purchased to size for a few pence.

Two eyehooks are required to be screwed into the back of the frame about $3\frac{1}{2}$ in. down, and to these a suitable length of thick white string is attached for suspension. **H. A. LEYTON.**

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

PICTURES in the SNOW

By L. TYLER.

THE miniature camera is a great boon to those who wish to make a series of snow pictures.

In this country, at any rate, it is not generally brilliantly sunny when snow is on the ground. The reverse is usually the case, and the dull light at these times calls for a generous exposure to secure good negatives. Even the most inexpensive miniature is equipped with a lens of fairly large aperture. This enables one to give a sufficiently long exposure without the necessity of carrying a tripod, and erecting it on each occasion—a tiresome business that, in cold weather and on slippery ground.

But if the sun should be so good-natured as to put in an appearance, so much the better. Not only does the brighter light mean that exposures can be reduced—either by faster shutter speed or by smaller

Right: CHRISTMAS DAY.

Below: WHEEL-TRACKS IN THE SNOW.

self-erecting mechanism and simple manipulation, I can make my exposure and tuck it away again in a few seconds. Its $f/3.9$ lens allows ample exposure to be given in the hand, so no stand is needed.

A fairly fast pan, or orthochrome film should be used. There is no point in using slow negative material now that manufacturers are turning out really fine-grain films with a high speed-rating.

OFF SHOOTING. $1/50$ th sec. at $f/3.9$, Isopan film.

aperture—but in addition all the subjects one meets are vastly improved by the introduction of lights and shadows, and many new subjects, in which the theme is the play of light on the surface of the snow, make their appearance. These are especially effective when the sun is low, so have breakfast early on a snowy morning and get the camera into action before the sun rises too high or the snow begins to melt.

With my five-guinea Agfa Speedex tucked away in my overcoat pocket, I enjoy a brisk walk in the snow, and can slip it out quickly. With its snappy

THE VILLAGE STREET. $1/50$ th sec. at $f/3.9$, Isopan film.

Keeping Enlarger Lenses Clean By G. K. SEAGER.

Fig. 1. Clean the lens of your enlarger carefully.

ENLARGER lenses seldom get dirty suddenly, as that of a camera does, for instance, in a shower of rain or on a gusty, dusty day. More often it is the case that they accumulate dust and condensation in a homœopathic way, and the

result is that one wakes up one day to the fact that enlargements are neither so crisp nor so free from mysterious greyish patches as formerly.

"Film," Smears, and Dirt.

It is "film" on the projection lens which gives rise to slight soft-focus and general dullness of the picture, and smears or bits of foreign matter on the condensing lens which produce fuzzy, semi-opaque places which show as vague patches of grey on the prints. Of course I have known of many cases where a damp finger has suddenly caused the projection lens to show temporary loss of definition. This can happen by missing one's aim when stopping down in the religious gloom, and allowing the moist finger to touch the glass surface by mistake. The smaller the negatives, the greater the effect of neglect of such accidents.

Of two quite good precautions to take in order to delay the gradual deterioration of performance, one is to keep the negative carrier always in the stage when the enlarger is not in use. This keeps a lot of dust out of the apparatus. The other is to keep a dust-sheet for covering the whole thing up. This keeps out still more dust and fumes.

All the same it is just as well to have periodical overhauls. To clean the projection lens, first remove loose dust with a soft camel-hair brush, and then polish the surfaces gently with a scrap of soft chamois leather or a very old pocket handkerchief. In either case,

Fig. 2. The cleaning-rag serves to make sure the condenser has no finger-marks.

keep the cleaning material in a closed box for that purpose exclusively.

The condenser too will require occasional polishing, and when replacing it hold it by the cleaning rag. Then there will be no finger-marks to cause uneven patches on the next batch of enlargements.

A New Developing Method for Miniature Films

By C. A. OLDROYD.

THE new-comers to miniature photography, and even sometimes the experts, are bewildered by the apparently endless choice of developing systems for 35-mm. film. If the full speed of the film is to be utilised one of the metol-borax formulæ is advised, but for the finest grain a startling array of paraphenylene-diamine formulæ makes the choice of the "best" developer very difficult indeed.

The fine snapshot weather has left us, and for winter work we must utilise the full speed of film material. A German experimenter, T. Kisselbach, has applied the old "compensating" developing method to miniature work, and gives an account of his experiences in a new German publication dealing with miniature work exclusively ("Das Kleinbild," published by Knapp, Halle, No. 3, August, 1937).

He points out that, although originally developed to produce good negatives with difficult lighting conditions, the compensating developing method is ideal for miniature work, used as a standard procedure in all cases. The formula for the two baths required is very simple, and the developer is cheap

to make up. The film is first placed in Bath I, in which the high-lights come up, while the whole surface of the film absorbs a certain amount of developer. The film is left in this first bath for three to ten minutes, according to the film material, as table below.

Without rinsing, the film is now transferred into Bath II, where it is left for three minutes without agitation. This second bath brings up shadow detail, the development of the film taking place with the amount of developer absorbed in Bath I, energised by the soda in Bath II.

Although principally intended for use with fine-grain film, very good results are claimed for this developing method with fast film of the Agfa I.S.S. type; and for artificial light exposures this developing system is said to be hard to beat. The full-size reproductions from Leica enlargements taken on the fast film certainly prove the author's assertion.

No claim is made that this developer produces a fine-grain action which could only be obtained with a special F.G. developer at the expense of speed, but the proposed system keeps the grain of the new fine-grain films down to the

least obtrusive level. With the new F.G. film material and this developing method the resolving power of the film material is as good as can be achieved with present-day methods, since the developing takes place in the main on the surface of the film.

The developer can be used repeatedly.

FORMULÆ AND TIMES.

Bath I.

Metol ..	26½ grs.	(3 grm.)
Sodium sulphite (anhydrous) ..	265 grs.	(30 grm.)
Water to ..	20 oz.	(1,000 c.c.)

Bath II.

Sodium carbonate (anhydrous) ..	130 grs.	(15 grm.)
Or crystals ..	350 grs.	(40 grm.)
Sodium sulphite (anhydrous) ..	88 grs.	(10 grm.)
Water to ..	20 oz.	(1,000 c.c.)

In making up Bath I dissolve a little of the sulphite in the water at 40° C. (105° F.), then dissolve the metol, and finally add the rest of the sulphite. This latter chemical can be used in crystalline form if desired; double the quantities shown above should then be taken.

Development Times at 18° C. (65° F.)

Film.	In Bath I.	In Bath II.
Agfa Isopan FF (new) ..	3 to 4 mins.	3 mins.
Isopan F (new) ..	4 to 6 mins.	3 mins.
I.S.S. ..	10 mins.	3 mins.

Information for other films is not given in the German original, but as the time in Bath II is unvarying, a close enough estimate for a first trial of the time required by other films in Bath I can be made by comparing the relative development times of the above and other films in any development table.

Modern Miniature Enlargers

THE STÜBIGER AUTO-MINIATURE.

OF the three sizes in which the Auto-Miniature enlarger is made, the one we have had the opportunity of reviewing is designed for negatives of size up to 6×6 cm. It is a vertical enlarger fitted with automatic focussing, it being necessary only to raise or lower the projector-head to bring the image, which remains sharp as it expands or contracts, to the exact size required.

The baseboard is of stout material and carries a tubular upright about 30 in. high. The up-and-down movement of the head is done by releasing a spring-clamp, when the arm can be slid along the upright into the required position. The lamp-house is large and roomy, and takes a 75-watt lamp in screw cap. Since it is intended that an opal lamp shall be used, no provision is made for centring it.

The enlarger can be had at choice with a diffusing screen, a single condenser, or a double condenser. The model reviewed had a single condenser, which is detachably mounted in a square metal cell that fits into a rim in the lower part of the lamp-house, just above the negative carrier.

The lens fitted is either a three-component f/4.5 enlarging anastigmat by Laack, or, at a slightly higher price, a four-component f/3.5 anastigmat with iris diaphragm. In either case, the focal length of the lens fitted to the 6×6 cm. model is 7.5 cm. A swing-out red filter is fitted as standard equipment.

The automatic focussing is controlled by a metal fin clamped at each end to the upright, from the front of which it projects. This fin is shaped so as to operate the focussing mechanism, tapering from a width of about 1½ in. at the top to about ½ in. at the bottom, the curve of the front edge being such as to impart the correct movement to the lens-panel as the projector-head is raised or lowered. The mechanism, except for the end of an arm which projects from within the metal casing between upright and projector-head, is entirely enclosed.

A noteworthy point is that the controlling fin can be raised or lowered a little on the upright, thus making it possible to correct the focussing exactly for the error introduced by using a masking frame, which, by lifting the paper off the baseboard, would otherwise remove it from the plane of sharp focus. After the adjustment has once been made sharp focus is automatically obtained at any position of the head.

The negative carrier is designed for film in the strip, which is held between two glass plates. These are normally pressed together by a spring, but can be locked in the "open" position to allow a fresh negative to be brought into position or for the easy insertion of a new strip of film.

The range of enlargement is from 1½ to 7 diameters, the latter figure corresponding to a print 16½ in. square from a full 6×6 cm. negative. Greater enlargement than this cannot be obtained.

The Stübiger Auto-Miniature enlarger costs £13 17s. 6d. in 6×6 cm. size when fitted with single condenser and f/4.5 lens, while a similar model for negatives up to 4×4 cm. costs £13 2s. 6d., or £12 12s. fitted to take a Leica or Contax lens. This gives a range of enlargement from 1½ to 10 diameters, making a print up to 15½ in. square from a full 4×4 cm. negative, or about 14×9½ in. from a 24×36 mm. negative. Further details and prices can be obtained from the sole importers, Messrs. Actina Ltd., 19, Woodstock Street, Bond Street, W.1.

Miniature Camera Gossip

By LANCELOT VINING.

THIS brings you my best wishes for a very happy Christmas and may Santa Claus bring you all the extras you want for your miniatures. I met the gentleman (he was dressed as a Bishop and had a black attendant) in an Amsterdam night club during the festival of St. Nicholas early in December. Presents are exchanged in Holland on this date instead of on Christmas Day. He presented me with a pack of cards and a diary, both of which were glaring advertisements for the night-club brand of champagne. I hope Santa won't be as cheap with you.

Young Miniaturists.

When I visited St. Paul's School for their photographic society's exhibition, I was surprised to hear that as many as 60 per cent of its members owned miniature cameras. I was more surprised still when I examined their work,

ST. PAUL'S SCHOOL PHOTOGRAPHIC EXHIBITION.

as there were very few of what I call real miniature pictures, and only two which showed any action at all. Nevertheless, the standard of work was very good.

After tea I demonstrated my Mendelsohn, at the same time making a test for my own edification; we were at

SANTA CLAUS READS HIS SPEECH. 1/25th sec. at f/2, I.S.S. film.

one end of the dining-hall, and I was anxious to see if I could light the far end and hold the foreground with one Photoflux.

I gave a full exposure, meaning to cut down the development time, but when I reached the dark-room I remembered that the other exposures on the film were slightly on the under side, and as they were of some importance I decided to let the flash take a chance. I think No. 16 saved the situation, but recently it has given me more grain than I like or want, so I shall have to make another alteration and start my tests over again.

Flash News.

Messrs. Mendelsohn write to say that they have asked Messrs. Philips to send them a batch

of Photoflux No. 2 lamps, so that in future all their speedguns will arrive in this country synchronised for this wide-peaked lamp. A phone message to Messrs. Philips brought forth the fact that the lamps are already on the Atlantic, so the next batch of speed-guns should have the correct adjustment.

Inexpensive Miniature.

CHRISTMAS SILHOUETTES

By ALAN D. FAIR (New Zealand.)

A BRANCH of photography at which I think every owner of the inexpensive camera should try his hand is that of making silhouettes. No accessories whatever are needed (except, perhaps, a tripod), your lens need not be of fabulously wide aperture and even such modern (and expensive!) material as supersensitive panchromatic films are of little advantage. In fact, the simplest apparatus and a modicum of time and originality are

"brief time" exposure will do). The two pictures reproduced here were given about 1 sec. at f/6.3 with sheet over the front door on a sunny day.

Development should, on the whole, be fuller than usual, even for the semi-silhouette. For the full silhouette, where the figure is to be in solid black against a plain white background, the longer development is continued the better.

Photographs of this type lend themselves especially well to the production of decorative designs, such as are usually preferred for Christmas, New Year, or birthday greeting cards, or for book-plates, menu-headings, and the like. "Properties" of all kinds are very easy to introduce, for they need to be convincing only as outlines. The cardboard Christmas tree in the examples reproduced here, which are my Christmas cards for this year, is a case in point. The personal touch in these cards adds to the value of the Christmas greetings, and certainly the enlargements were no dearer than bought cards would have been.

It is interesting to note, by the way, that though children are usually the hardest things in the world to photograph, they make excellent subjects for silhouettes. The reason is that the facial expression counts for very little, and as long as your model can be persuaded or induced to sit still where you put her (or him) a good, intimate rendering can usually be obtained. A few bon-bons or glowing tales of a glamorous Christmas Eve can be of infinite value in such cases.

A personal Christmas Card in semi-silhouette form.

the only necessities in the making of really satisfactory silhouettes.

The method of making silhouettes has been dealt with before in "The A.P." so I do not intend to go into great detail. The principle is this: A white sheet is pinned over some opening, such as a door, and a strong light placed behind it. If you are working at night, electric light should obviously be used, but if working in the daytime I have found it just as satisfactory to pin the sheet over the front or back door and use daylight. The subject is placed in front of the sheet, that is, the same side as the camera, and a short exposure given.

The exposure should, however, vary according to the degree of blackness required. If you want a picture in dead black and clear white it is necessary to give a rather short exposure (1/25th sec., on a dull day, at f/6.3 is sufficient).

But if you are posing a member of your own family, and want the result to be more personal, it is better to make a semi-silhouette. To do this the exposure should be prolonged (a short

Toys replacing the child makes the appeal of this less personal but more general.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

CHOICE OF TANK.

Which is the best type of tank for miniature films, that using an apron or that with spiral grooves? And is bakelite or stainless steel the better?

I. D. M. R. (Brookwood.)

We do not think there is anything to choose between tanks using an apron and those with spiral grooves. Each type is used with complete success by large numbers of photographers. Choice of material is unimportant too, as both bakelite and stainless steel are quite unaffected by the usual photographic chemicals. The most important thing in selecting a tank for miniature work is to choose one so designed that the film may be developed, fixed, and washed without removing it from the tank—or at least, without removing it from the spool—so that it runs no risk of being damaged by handling while it is being processed.

BLURRED ENLARGEMENTS.

I enclose four enlargements, which as you will see are not sharp, though the negatives are. The enlarger is horizontal, using an R.R. lens at f/8, and care is taken to prevent vibration during the exposure. The image on the easel appears quite sharp, and is certainly much sharper than the print enclosed. Can you tell me how to get over this difficulty?

W. L. G. (London.)

It is a pity that you are getting this trouble with your enlargements, which are otherwise very promising. If you are sure that the image you see when focussing is perfectly sharp the only explanation we can suggest is that the lens you are using is not properly corrected for colour. That is to say, the position where you get an image that is sharp to the eye is not exactly the same as the position where you would get a sharp photographic image. You might be able to get better results if you stop down to f/11 or f/16; at any rate, the experiment is worth trying, although it will increase the exposures. Or you could make a series of test prints, shifting the lens each time a short known distance away from the position of best apparent focus. If any of the results are sharp, you will in future be able to focus, as before, by eye, and then move the lens through the distance found necessary to give photographic sharpness.

TWELVE INSTEAD OF SIXTEEN.

My camera takes either 8 or 16 exposures on a 3 1/2 x 2 1/4 film. Usually I use the mask and get 16 exposures, but the camera is so much more convenient to hold horizontally that I should like to take to the modern square shape (12 exposures per film) so that I could have it always the one way up. If I make a mask 6 x 6 cm. and fit it, or cut out the 4.5 x 6 cm. mask to this size, how do I use the two windows so as to get 12 exposures?

P. S. V. (Stourbridge.)

Many films are nowadays marked with numbers from 1 to 12 along the centre-line of the paper. If you make a new window in your camera-back and use one of these films you will have no difficulty at all. It will be worth your while to waste a shilling film by using it as a guide for marking the position of the window.

STRANGE MARKINGS.

I took the enclosed photograph by flashlight at f/3.5. Can you tell me the reason for the extraordinary network of curved black lines that has appeared on it? None of the other negatives on the spool of 36 exposures shows these markings.

L. M. (Londonderry.)

The markings on your negative were almost certainly caused by moving the camera about with the lens open while it was pointed at a source of light. The dark lines represent the track of the image of the lamp across the film.

COVERING POWER.

I have heard it stated that a 3-in. lens will cover a 4.5 x 6 cm. negative. I have a telephoto lens of that focal length which I got from a 16-mm. cine camera; could I use it for enlarging from 4.5 x 6 cm. films?

M. S. V. (London.)

The covering power of a lens does not depend only upon the focal length. Some 3-in. lenses will cover a quarter-plate; others will not cover even the much smaller negative you use. Your telephoto lens was evidently designed to cover the tiny negative obtained on 16-mm. film, and though it might give reasonably good definition over a rather larger area than this it will quite certainly cover no more than a very small patch of your 4.5 x 6 cm. negative.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDXVII.

Mr. R. M.
KIRKPATRICK

From information communicated to our Special Representative.

"MY photography is divided into two main groups—the pictures I make for pleasure, and those I take in my capacity as publicity adviser. For both classes of work I strongly favour the high-grade twin-lens reflex which I find a most useful all-round camera. I consider that the time is not far distant when every commercial studio of note which specialises in advertising work will make great use of the miniature camera. This is already the case among the leading photographic studios of Germany and America, where the miniature camera is even invading those fields in which the cumbersome stand camera has hitherto been considered supreme.

"The miniature camera offers so many advantages. The more important are, of course, its economy of material, speed of operation combined with great

depth of focus, and the opportunities it provides to obtain those intimate pictures of everyday happenings so widely sought in advertising. A miniature camera can always be carried ready for instant use, and so unobtrusive is it in action that often the subject does not know he has been photographed at all. In this way perfect naturalness is assured, and wonderful opportunities provided for 'candid photography.'

"It is very probable that I get more enjoyment out of the photographs I have to take in connection with my business than those I take for pleasure! The reason is that they are more in the nature of problems. I am given definite limitations: I may have to photograph an exceedingly commonplace object and yet obtain a picture that will lift the article right out of its class! Perhaps this is why I do not condemn striking

and forceful angle shots—so long as they are from an unusual but not 'freakish' viewpoint.

"My 'pleasure photographs' are mainly landscapes and portraits. Apart from lighting and composition, to which I pay great attention, no hard and fast rules as to how I work can be laid down. I always feel that a landscape without clouds is only 'half there.' I therefore tend rather to strong correction of skies in order to emphasise them.

"In portraiture, my aim is always to secure a natural picture of the subject (there is no need to repeat how the miniature camera helps me here!). Any variation is created by lighting effects. I favour the high-wattage lamps against the overrun type, which in my experience I find tend to give an undesirable hardness. Incidentally it is only in portraiture that I am fond of diffusion. For all other subjects I like to see as much detail and sharpness in a print as possible.

"I am a great believer in the tripod and use it wherever possible for all speeds up to 1/100th of a second. Where speed is essential, I use hypersensitive pan. film, and on other occasions I favour Panatomic film. These are developed in D76, and whole-plate enlargements taken. From these prints one is able to select the correct portion and angle of the picture.

"I favour the Kodak Royal or Finisher papers for landscapes and portrait work, but invariably produce a glazed print on a contrast paper for commercial work. I do not favour any 'faking' or retouching outside the usual spotting, and control during enlargement.

"I use one of the modern vertical types of enlarger and find that a lens of the same focal length as the camera objective gives excellent depth. This is important since many of my shots are architectural studies. I find the reflex camera very valuable for this architectural work. The ground-glass view-finder with its picture the correct way up makes the taking of verticals fairly easy. If I do produce a picture with a slight tilt, this may be overcome, without distortion, by correction in the enlarging."

(A further example of Mr. Kirkpatrick's work is reproduced on one of the centre Art pages.)

St. MORITZ.

R. M. Kirkpatrick.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THE CLOWN," by Paul Shillabeer.

HERE is another thing to remind us that Christmas is but a few days off, for clowns and circuses and things are hardy annuals that pop up about this time and do not a little towards the general merriment. And of a clown the portrait is characteristic. The way the head is shown—peeping out from behind a screen—is reminiscent of his sudden emergence upon the scene with a witicism that convulses the house, and his coyness in waiting for the inevitable applause.

It is very interesting and lifelike, and, in its class, it is a decidedly good example. Moreover, the fact that it is a product of a miniature camera is noteworthy, and, seeing that the subject was taken by artificial light, it provides an illustration of the extended range of its capabilities. I should think—but do not know for certain—that the subject is the result of an instantaneous exposure, the camera being held in the hand. So much might be inferred from its nature, the fact that it was taken by artificial light, and from the way the expression has been caught. There is a whimsicality about it that, I feel, could not have been held for long, and its spontaneity does not seem to suggest that the subject has been bothered to pose or made to wait for manipulations of the camera.

My assumption may be wrong, but if the subject should have been posed and the whole thing deliberately arranged, it reflects no less credit upon the author, for it is exceedingly well done, and there is nothing from which the contrivance can be deduced.

The technical details, too, are most precisely arranged, the focussing being most exact and the definition being as sharp as it well could be. The texture of the skin through the make-up is very much in evidence; the added accessories—even to the division between the face and skull mask—are

perfectly plain; and the details of the difference between the actual facial features and their grease-paint distortions can readily be perceived. That all this has been provided from a negative but little larger than a postage stamp is, when we come to think of it, very marvellous; and illustrates the advances that have been made in lens and camera con-

The one on the left just misses the vertical centre and is well above the horizontal, so that, positionally, the condition is satisfied, and the only other thing that calls for remark is the fact that the way the head is inclined suggests a diagonal form of composition. That adds to the force of the presentment and makes it virile and immediately attractive.

The lighting, too, so happens that the face is thrown into prominence in comparison with the neck and such of the body as is visible. This is an excellent point, and, while the nature of the subject will not render it equally acceptable to everyone's taste,—no two think alike in these things—pretty well all the elements which I have singled out for mention could be applied in connection with portraiture of other types. A similar lighting, for example, might be most effective with either a portrait of an aged man lined of face and shaggy of hair, or a girl of seventeen with rounded features and perhaps a dimple. The inclination of the head is a pose that would be appropriate in both, and the position of the eye would be equally effective whichever the case. I do not say, however, that, in the case of the girl, such fineness of definition would be as acceptable, for, if make-up did happen to be employed, and its presence were as plainly revealed, it could scarcely be expected to be viewed with equanimity!

However, it might be passed over at this season, particularly if the photograph were not the only present at the same time, but the experiment is one I should not like to recommend even to the most caustic of the practitioners of candid photography. And their libellous horrors do demand some punishment, judging from some of the things I have seen, and, if any of them are seen to be at work on the 25th round about dinner-time or after, banishment is too light a sentence. Merry Christmas. "MENTOR."

struction during the last few years.

The same standard of workmanship extends to the making of the negative and print. The latter is of excellent quality, and, if the background strikes one as being rather heavy for the brightness of the face, we do not know the circumstances under which the subject was taken and have to assume that nothing lighter was available.

As far as composition is concerned, there is little more in it than seeing that one of the eyes is placed off the centre but in a sufficiently strong position to form a focus-point of interest.

PICTURES by Novices

*SOME CRITICAL COMMENTS on
the Beginners' prints reproduced on the opposite page.*

EXCEPT for its excessive length of foreground, No. 1 of the prints reproduced on the opposite page—"The Street Artist," by A. G. West—makes a very good composition and the subject has been well seen and caught at a fortunate moment, but it could be wished that the splash of sunlight fell just a bit lower so that the dark of the figure were silhouetted against it.

Dark Against Light.

The contrast of dark against light would have enhanced the attraction of the figure enormously. It does not tell at all badly even now, but it is inclined to lose itself against the background and really needs the emphasis the contrast would afford.

But this is a feature that was settled, once and for all, when the exposure was made. It is easy enough to see it now the print is made, but, short of very extensive retouching, it is impossible to correct matters now. It may be that, either shortly before or after the exposure, the shaft of sunshine did extend to illumine the setting behind the figure, but, without a knowledge of the vicinity, it is impossible to say.

The point, however, is one that should have been watched for at the time, and, if it appeared that the patch of setting was likely to get brighter, the exposure might have been deferred. If, on the other hand, it seemed as though it would be earlier when the light was so disposed, arrangements could be made for a visit at the appropriate time on another occasion.

Simplicity of Statement.

What I feel about it is that the figure needs to be a bit more effectively isolated in order that it may properly serve its purpose as the centre of interest, and that placing it against the light is the only feasible method.

Had the figure been caught in a standing position, looking down at his work, the effect would be just as good, and it may have been that he would be impelled to do so sooner or later, in which event the exposure could then have been made and the necessity for waiting till the lighting altered or making another visit avoided.

The composition would retain its simplicity of statement but would gain from the extra concentration arising from the contrast of extremes of tone. Something of the effect can be imagined from No. 4, "The Church in the Woods," by Guy Dennis, although, in this instance, the centre of attraction is in light and the setting in darkness. The contrast of extremes, however, is still the same, and, despite the reversal, is just as strong.

The consequence is that the subject tells with excellent effect. It is as simple in its statement of fact as the other, and there is no doubt about its intention. The sunlit church is the unquestionable centre of interest, and, from the pictorial standpoint, I think there is no doubt but that the sunshine forms a wholly adequate motive.

Subject and Motive.

Nevertheless, I would be inclined to recommend a trim of about a quarter of an inch from the left-hand side, for the church is rather centrally placed at present, and the slight alteration would correct this disability.

In the case of No. 3, "Via Dolorosa," by H. G. Mather, there is a suggestion of a similar motive of sunshine, but it does not get across quite so well, partly for the reason that the elements in sunshine are not so definitely isolated, and partly because of the competition arising from the bright tone of the sky. If it were just a shade lower than that of the sunlit wall, the sunshine would tell much more effectively, and, were I making a print by one of the control processes, I do not think I should have much difficulty in making the needful adjustment; but, with a beginner, I feel it would be inadvisable to do more than suggest that it might be tried by local control during the printing exposure, i.e., by slightly overprinting the sky while the rest of the print is masked.

Providing it is carefully done and the mask kept moving during the extra exposure, the expedient is quite easy to manage and has the virtue that it does not show. It would not only improve the subject immensely, but would also bring out the motive of sunlight, so that a series of trials

should make a very interesting and educational experiment.

Power and Placing.

With No. 4 I suggested that the placing should be revised so as to put the church more off the centre, but in the case of No. 1 there was no need to alter the position of the figure after the removal of the excess of foreground, it having sufficient power of placing as it is; but in No. 5, "The Temple of Pallas Athene," by R. J. Hayman, the portico, which by reason of its prominence acts as the centre of interest, is made to occupy a position too near the edge to fulfil that function.

It ought to be at least half an inch nearer the centre of the print, when its power of placing would be just about right; but, of course, the only way in which this could have been managed was by arranging for the line of sight—and the camera—to be directed more to the right.

That is now impossible, but, while the subject is one that naturally makes up better as a horizontal, the position could be corrected by trimming three-quarters of an inch from the left and turning it into a vertical. The composition would be appreciably improved, and, in the circumstances, it is the best that can be done. At all events, it enables the dignity of the ruin and the better part of the fine sky to be retained, and, moreover, avoids the scrapping of the print.

Tones in Opposition.

The texture of the wall is a feature of No. 6, "Cottage Doorway," by R. N. Rook, but, while the doorway might be expected to tell in the midst of so much light, it does not quite work out.

Probably the reason is that there are too many other darks of equal if not greater depth, and the brilliance of the lights is overwhelming. The fact that the doorway is not an isolated feature in a scheme that is otherwise light is a contributing factor of some importance, for, just as the light of the sky reduced the appeal of the sunshine in No. 3, so do the darks of the adjacent shadow, the dark under the eaves, and the depth of tone in the fence pull away from the attraction of the door.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

IMPROVISING AN ENLARGER—II.

I SAID last week that there are great differences in the appearance of enlargers, even though the fundamental principles underlying them are the same. The two forms illustrated on this page have a general resemblance, although they are very different from the horizontal form shown last week. Yet if we follow their parts in order it is evident that they correspond. We get the lamphouse carrying the illuminant; the condenser, or diffuser, or both; the negative carrier; the lens. With the horizontal model there was a separate easel to carry the bromide paper; in these vertical models the paper is placed on the base. In all cases the lens-negative distance and the lens-paper distance can be varied.

It must be understood that when I mention specific apparatus or parts I am not recommending them in preference to others of a similar kind, but only to illustrate the points to which I wish to call attention.

Fig. 1 is Lancaster's "Amplus" enlarger, No. 2, Form C. It is made for $3\frac{1}{2} \times 2\frac{1}{2}$ or for $\frac{1}{4}$ -plate negatives. The ventilated lamphouse is of metal, and the plano-convex condensers are removable for cleaning; there is also a detachable diffusing screen. The negative carrier is of wood. Where I quote prices they are for $3\frac{1}{2} \times 2\frac{1}{2}$ size.

There is a model A which can be fitted to take the customer's own camera and lens if suitable, and it costs £2 12s. 6d. Model B has bellows and lens panel to take the customer's

Bellows also he can buy in many sizes, here or from a firm specialising in them. Various woodwork parts are also available, although these are the things that the home mechanic is most likely to be able to improvise. If he is really handy he can do much with wood, metal and cardboard. Even if his work is not up to commercial standard it will serve provided it is accurate. For it must be remembered that no enlarger will give good results unless it is so made that the various movements and adjustments are reliable and correct. It does not take much to upset its proper working.

Before passing on I may mention that Fig. 2 shows the Thornton-Pickard "Perfecta" enlarger, a semi-automatic model of sound and substantial construction. The price for the $3\frac{1}{2} \times 2\frac{1}{2}$ size, without lens, is £6 5s., for $2\frac{1}{4} \times 2\frac{1}{4}$ £6, and for $2\frac{1}{4} \times 3\frac{1}{4}$ mm. £6 6s. fitted to take the customer's Leica lens.

A reader informed me recently that he had picked up an old half-plate studio camera, with telescopic wooden body, and a portrait lens. He asked if he could use it as an enlarger. I pointed out that there was a great deal more than that in an enlarger, and that even the lens would be quite unsuitable as a component part, especially as his negatives were only $2\frac{1}{4}$ in. square. He might just as well try to use a set of old wagon wheels on a motor car.

The proper way to set to work is to draw up a general specification of the enlarger required. This would give such points as the size of negative, and the maximum and minimum degrees of enlargement; the light to be used; whether a condenser or a diffuser; and so on.

The next step is to consider the necessary harmony or relationship of certain parts. For example, there must be an approximate relationship between condenser and lens, the focal lengths of which must not differ too widely.

I showed by diagrams last week that the rays of light from a condenser can be brought to a rough focus at various distances according to the position of the lamp. But there is a limit to these distances. The cone of rays shortens

Fig. 1.

own lens, again supposing it to be suitable. This form costs £3 7s. 6d.

The Model C illustrated is complete, and the prices are £3 17s. 6d. (achromat lens), £5 2s. 6d. (f/6.3 anastigmat), and £6 2s. 6d. (f/4.5 anastigmat). These prices may all be higher to-day, but they give an idea of comparative costs.

Now Messrs. Lancaster make a feature of selling separately the component parts of this and other enlargers, and this is particularly useful to the beginner who intends to build his own apparatus. Some of the necessary parts he may already have available, others he may be skilful enough to design and construct for himself. He certainly cannot make a lens or a condenser, and everyone who makes an enlarger at all will certainly have to buy some of the parts if he has not already got them.

He may find it necessary to buy a lamphouse, unless he is used to working in metal, and he will find several forms available in Lancaster's list. He can buy a pair of condensers and mount them himself, or get them ready mounted.

Fig. 2.

as the light is moved farther back, but beyond a certain distance no further shortening is possible. The cone lengthens as the light is brought nearer to the condenser, but here again there is obviously a limit.

The position of the focus of the condenser depends on the position of the lens, and the position of the lens depends on its focal length and the degree of enlargement.

These positions of the lens can be worked out with sufficient accuracy beforehand, and I will repeat the method of doing it.

The degree of enlargement is reckoned in "diameters." If a line in the negative is made twice as long in the enlargement that is two diameters. If a 3×2 negative is made to give a print 12×8 that is four diameters. To the number of diameters add 1, and multiply this by the focal length of the lens, and it gives the distance from lens to paper; divide this distance by the diameters and it gives the distance from lens to negative.

Suppose we have a 4-in. lens, and we want to make enlargements from $1\frac{1}{2}$ to 6 diameters.

$$4 \times 2\frac{1}{2} = 10 \text{ and } 10 \div 1\frac{1}{2} = 6\frac{2}{3}$$

So that to enlarge $1\frac{1}{2}$ times we must place the lens $6\frac{2}{3}$ in. from the negative and 10 in. from the paper.

$$4 \times 7 = 28 \text{ and } 28 \div 6 = 4\frac{2}{3}$$

So that to enlarge 6 times we must place the lens $4\frac{2}{3}$ in. from the negative and 28 in. from the paper.

When a condenser is used its diameter must be a trifle greater than the diagonal of the largest negative to be accommodated. The usual position of the negative is close to the front surface of the condenser, and its film surface is facing the lens. There is no trouble about fixing a glass negative in the carrier by means of small brass toggles turning on screws. A film negative is generally sandwiched between two pieces of glass, the rebate of the carrier being made sufficiently deep to take them.

The focal length of the lens should be about the same as the diagonal of the negative, which it must be capable of covering sharply right to the corners. In other words the lens should be capable of making the negative, so that the lens from the camera with which the negative was made will probably be suitable.

Unfortunately, in many modern cameras the lens cannot be removed and transferred to the enlarger. In other cameras the lens screws into a flange, and in such a case it is an easy matter to get a similar flange to attach to the front panel of the enlarger, and then the transfer of the lens is a matter of a few moments.

A good alternative is to look out for a suitable lens. An anastigmat is the ideal, but a good rectilinear lens can be picked up second-hand at a very low figure. It may need stopping down to $f/11$ or even $f/16$, but that is not a serious disadvantage.

W. L. F. W.

NOVELTY CALENDARS FOR XMAS AND NEW YEAR GIFTS

By C. CHAFFEY.

AT this time of the year quite a number of amateur photographers prepare photographs and attach small block calendars for use during the coming year.

The process about to be described is simple, inexpensive, and will give an added value to prints so treated, in view of the fact that not only is the date available, but also an approximate indication of the weather, thus rendering it in effect a photographic barometer. To the modern generation of amateur photographers the method of making these prints will probably be new.

The essentials are: (1) a bromide print of a river scene or seascape with a "blank" sky (not smaller than half-plate); (2) suitable mounts for same; (3) small calendar-blocks, and (4) an inexpensive solution, referred to later in this article.

The procedure is as follows:—

The enlargement is hardened for 15 minutes in a 10 per cent solution of formalin (e.g., formalin 1 oz., water 9 oz.), after thoroughly fixing, and is well washed in running water for an hour. The print is then dried, trimmed and mounted by any method familiar to the operator.

The next step is to fix the calendar pad, either direct to the lower margin of the mount itself, or suspended from the lower edge of the mount with

short lengths of coloured ribbon. A loop of ribbon should also be attached to the back of the mount near the top edge, strong adhesive being used; this is to be used for hanging the finished article from a convenient support.

Next comes the conversion of print to barometer, the following formula being used:—

Gelatine (Nelson's No. 1)	120 grs.
Cobalt chloride	60 grs.
Glycerine (pure)	24 drops
Water	6 oz.

Prepare thus: pour into a cup (not a glass) 6 oz. of water and add the gelatine in small pieces, stand the cup in a saucepan of hot water and submit to gentle heat. When the gelatine is thoroughly dissolved add the cobalt chloride and stir till dissolved, after which the 24 drops of glycerine should be added, the whole being vigorously stirred.

Now, with a medium-sized artist's water-colour brush (No. 2 or 3 will do) apply the mixture to the sky and water portions of the print and leave a few hours to dry.

The parts of the print that have been treated with this solution will acquire a bright blue hue in dry weather which changes to a pink colour in damp weather, the cause of this change being due to the effect of moisture on the chloride.

A suitable phrase in the form of a rhyme should be neatly written on the lower margin of the mount, which could read something like this:—

When the sky is red, I feign
Very soon will come the rain,
But whene'er it turns to blue,
Sunshine is in store for you.

or:—

When the skies are turned to blue,
Old King Sol will soon peep thro,
But when it's tinged with red you bet
'Twill very shortly turn in wet.

The novelty is then complete except for brief "Instructions for Use" which should be written on the back of the mount, stating that this barometer should not be hung near a fire, but on a wall subject to the natural atmosphere prevailing.

Of course, it will be realised that other subjects may be similarly treated, the dress in a lady's portrait, flowers in a still-life subject, etc., and discretion of the photographer must be used in this respect.

The cobalt solution will solidify on cooling, but may again be rendered liquid by submission to gentle heat, when it is required for further use.

Prints submitted to this treatment are not materially affected in quality if previously hardened as instructed, prints I have treated three and four years ago show no sign of deterioration whatever.

MAKING BETTER SNAPSHOTS—29

By DAVID CHARLES.

This article is the twenty-ninth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

WHEN I offered the advice that flashlight with combustible powders should be avoided just at the Christmas festivities it was not intended to convey that it was not a perfectly satisfactory illuminant for portraiture or general indoor photography. All I desired to show was that the season of parties is often accompanied by the

persons being photographed have time to blink their eyes. The occasional photograph showing eyes half-closed results where the sitters know exactly when the flash is coming, and close their eyes in automatic self-protection against the sudden flare of light. Or perhaps they were caught, as sometimes happens in daylight, at the exact instant of a normal blink.

Placing the Flash.

A good deal of the success of flashlight depends upon having the flash itself, like any other source of light, in the right place. It should be at least two feet to the side of and above the level of the camera. It is also desirable to see that there is something to act as a reflector on the "shadow side" of the sitter or group. This may be either a light-coloured wall or a sheet thrown over a screen. Excepting in an unusually pale sort of room shadows and general surroundings are very liable to be under-exposed

Fig. 4. Longer exposure and short development in a "soft-working" developer make all the difference. Or, as here, the negative can be "treated" for its ailments.

If one is using a lens of greater aperture than, say, $f/4.5$ this series of operations must be done very neatly and swiftly to avoid a secondary image from the normal lights, though of course, shutter and flashlamp can be synchronised to make the work still easier.

Fig. 1. The flashlamp was held too low and has failed to illuminate the dark hair against the dark background.

presence of festoons of tissue paper, which it is only too easy to set ablaze.

There are three simple and specific precautions which render flashlight safe. The first is to remember that the swift flick of light of which it consists is actually a large flame, usually larger than this page, which may scorch or even set alight any curtains or the like it may come into contact with. Therefore a flash should be fired well away from such things.

Avoid Old Powder.

The second is to avoid the use of flashpowder which damp or age has congealed into small pellets. Such pellets may become little fiery comets, which rocket impartially and irresponsibly on to a Persian carpet or down people's necks, their "trajectories" being faithfully recorded as white lines across the resulting photograph. The third precaution is the obvious one of keeping the flashlamp well away from one's own face.

The great advantage of flashlight is that it is both instantaneous and ample in volume. It is so swift that the light has come and gone before the

Fig. 2. Technically excellent, and a happy pose. But a hint of what was coming has made the eyes half close.

and consequently dark in the finished prints. Therefore only the fastest emulsions should be used for flashlight exposures, and special care should be taken to avoid over-development.

Making the Exposure.

A very simple and effective way of making flashlight exposures is to have the camera and the flashlamp on independent stands and to have a cable release on each, one held in each hand. The camera shutter is set at "bulb," which arrangement enables one to "open-fire-close" in rapid succession.

Fig. 3. Under-exposure and over-development give many flashlight photographs this intense crudeness.

Embossing Photographs

By H. A. ROBINSON.

THE following way of finishing photographic prints has the effect of making the main features of the image stand out from the rest of the print in strong relief, and was a method that received considerable attention from amateur photographers about thirty years ago. The possibilities in the method have not, however, decreased with the years and a description of how the work was carried out is given below.

It was not suggested that all prints should be embossed, indeed many, such as those full of minute detail, are not suited to this treatment. Bold prints containing one or two clearly defined items are, however, very suitable and emboss well. Portraits are particularly adapted to the process.

Accessories needed for the work are a little tissue paper, two "bulldog" clips, a rectangular frame of $\frac{1}{8}$ -in. plywood, another (this time solid) rectangle of wood and some $\frac{1}{8}$ -in. cardboard.

Taking the tissue paper, clip it over the print and trace the outline of the items to be embossed. Do this lightly, or a groove will be left in the print. The outline can be darkened-in away from the picture. Now clip the tissue to a suitably sized rectangle of the $\frac{1}{8}$ -in. card, with the pencil lines downward toward the card. The outline will be quite visible through the tissue and so it is an easy matter to go over the line with a hard pencil and impress a rendering of it on the card.

Having done this take a sharp-pointed knife and cut away the card inside the outline as indicated in Fig. 1. The card is shown thicker than necessary for clearness. The print is now prepared for treatment. This is done by pasting it on to a rectangle of thick blotting-paper, using if possible one of the special photographic pastes which contain no chemicals that

can hurt the picture. These pastes are also of the right consistency, being neither too thick nor too thin.

Well coat both the print and the blotting-paper, rubbing the adhesive in with the finger, and after placing together evenly and making sure there are no wrinkles place the two under some light weight for about a quarter of an hour. At the end of this time the print with its backing should just be nicely damp and pliant, but in no sense wet, a little practice will soon give the correct state to aim for.

Now take the two clips and the frame (which must be of suitable size) and clamp all together as Fig. 2, with image on the print lying exactly over the opening in the card and the frame on top. Work on the actual embossing may now start after placing the whole on a wood block as shown.

The embossing is effected with round smooth instruments like the back of a spoon and bone handle of a tooth-brush, etc.

Start with a light circular motion gently pressing downwards the general area that lies within the mask (Fig. 3). Do not press too hard as you may burst the paper and ruin the effort. As the motion of the instrument begins to take effect the edges of the image may be made rather more pronounced by a little harder rubbing.

Of course the art of the process lies in giving special prominence to certain parts such as noses, chins, and portions, say, of dress, always bearing in mind that in the main high-lights should stand out, while shadow parts are usually farther back. Raised shadows and depressed high-lights give a very poor result. While doing the general embossing, pressing down on the block it will be found possible to give the final little ridges, etc., holding the print and mask in the hand and working from the back, while looking at the front. Very marked ridges can safely be given by pressing fairly heavily on the back with a blunt point if a finger is supporting the front to prevent the paper breaking.

The whole business is one that improves rapidly with practice and it will be found that little personal methods, individual to oneself, are soon devised which give quickly and accurately certain realistic effects.

When at length the relief has been worked up to one's own satisfaction the print (still clamped in the frame) is put on one side to dry. As the moisture leaves, the paste stiffens and the relief becomes permanent. When quite dry, trim the print and blotting - paper truly and then mount by securing it to the card with glue run round the edges only.

The process forms a very novel and pleasing form of picture finishing, and is quite worth a trial.

We have received a copy of a new B.T.H. leaflet dealing with Photoflood and Photo-Pearl lamps. The first, familiar to every photographer, are small bulbs which, while giving about as much light as a standard 1,000-watt lamp, consume only 275 watts. This low consumption makes them safe to connect to ordinary household circuits. To get this brilliance at so low a current consumption the bulbs have to be of the over-run type, giving them only a short life of about two hours continuous

running. They cost 2s. 6d. each, and include a fuse to ensure that when their life is over they do not blow the main fuse and plunge the house in temporary darkness. Photographers with more robust electric mains, particularly those who wish to do a good deal of artificial light work, will find the Photo-Pearl lamp of interest. This, while giving about the same light as the Photoflood, consumes 500 watts of power and, being much less over-run, has a life of 100 hours of continuous use.

It will outlast dozens of Photofloods, yet costs but 20s. The bulb is about 4 in. in diameter, and the overall length, including the screw cap, about 7 in. The leaflet contains specimen portraits and groups, with diagrams of the lighting used for each and exposure tables for both still and ciné work. Our readers should obtain a copy; it will be sent post free, on application to the British Thomson-Houston Co., Ltd., Lamp Sales Dept., Crown House, Aldwych, W.C.2.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Pack your Projector this Christmas

By SIGURD MOIR.

CIRCUMSTANCES inherent in our economic life decree that we cannot all live "at home." Some of us, more fortunate than others, manage to get up for the week-ends. Not a few are perforce kept away for longer intervals; but unfortunate indeed are those who cannot return for the festive vacation.

Equally inherent is that aspect of our social life which leads Mr. Smith to close his house for three or four days and enter into the frolics of the Robinson household. You can see the trains—Christmas "specials"—packed with Mr. Smiths and with all our homeward-bound compatriots. You can see their luggage—close-stacked on the station trucks and in that over-crowded compartment known as the guard's van.

Amongst that luggage you will see scores and scores of suitcases, dozens of hat-boxes—and, here and there, a solitary projector-case. Let us agree there should be many more of the latter . . . for surely amongst these Christmas travellers are hundreds who dabble in the high art of amateur cinematography.

Perhaps the thought that a display of their hobby could interest others has never occurred to them.

Packing.

Well, now that it *has* occurred, it is advisable to sketch out the plan of a really ambitious entertainment right away. Let it be something rather out of the ordinary; and let it come as a surprise to all (or nearly all) of the Christmas company.

There must be suitable films to show and a thoroughly efficient projector to show them with. First of all properly inspect the machine. See that the friction surfaces of the drive and intermittent are first cleaned, then lubricated—and, finally, freed from all film of surplus oil. Clean the lenses and polish the outer surfaces of the condenser, taking care to use here only a soft and worn fabric—which will avoid matting the rather soft glass used in their manufacture.

Then take a look at the accessories. See that they are complete and in no need of any last-minute attention. Particularly examine the spare lamp, the belts (necessary only in the case of remote-drive machines), the alternative-gauge fittings, the resistance—especially about its connections, the splicing outfit, the screen and the spare or take-up spool.

When all these things have been done,

you may begin to pack. Do not close the carrying-case, however; there is usually room in the latter for some of the spools with which you hope to entertain the boys and girls at the Christmas party.

The Films.

Selecting the films is not an easy matter—for those same boys and girls are of widely-different ages. Here, as elsewhere, the simplest solution lies in taking the line of least resistance. Select only the types of film which will please at least a majority of your fellows. Avoid the abridged versions of picture-house successes and always select the clear, workmanlike shorts in preference to tedious monotonies, and don't forget the cartoons and "comics." They are likely to be the most popular of all.

Remember, too, that your own and other amateur work may often be preferred to the more stereotyped of professional releases.

For this occasion anything in the nature of drama should be avoided, and it is suggested that these reels might well

be a comedy, such as one of the immortal Charlie Chaplin, a good travel film, and a cartoon. Such a list will, in conjunction with the personal films, make a programme that can be enjoyed by people of all ages and types. With regard to the actual arrangement of the films, it is probably best to give the show a rousing opening by commencing with the comedy. Next comes a personal film, then perhaps the travel, another personal, and lastly, the cartoon.

Details and Showmanship.

When you have selected the films, pack them closely into the projector case and fasten the lock. Then put the key on your key-ring. Christmas may not be any too merry for you should it be left behind in the fuss and hurry of departure.

The actual arrangements in the room where the show is to be held should receive careful consideration. The best layout of seats to ensure for everyone an uninterrupted view of the screen should be decided upon beforehand, and on the evening the apparatus should be set up and the seats arranged while the audience is still in another room. Then,

Winter in the Park. Advantage should be taken of any fall of snow in Town to complete the documentary film of the "Seasons in London," already referred to during the spring, summer and autumn.

when, and only when, all is in readiness, the show may be announced as ready to begin.

The operator should, to ensure that the show shall go off without a hitch, if possible, take all possible precautions beforehand. He should, of course, have a torch handy, and a spare projector lamp, just in case. The films should be

stacked in the order in which they are to be projected, the first reel already loaded and threaded in the machine.

Another place should be ready to stack the finished reels, so that there shall be no confusion when the show is on. With regard to incidental music, this should be added if possible, and,

in addition to the light music that would naturally be used for a programme of this nature, it would be a good idea to work in some Christmassy music, perhaps in an interval.

In this way it will be possible to make the Christmas show the great success it ought to be.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

TESTING A LENS.

SIR,—I have seen it stated in "The A.P." and elsewhere that the circle of confusion of a photographic lens varies from $1/100$ th in. to a limit of about $1/500$ th in. in the finest examples.

As this seemed to mean that enlargements of over five diameters would show fuzziness, even with the finest optical equipment, and as many miniature negatives are enlarged very much more than this, a test was indicated.

The test object was a diagram in the form of a wheel of radiating black-and-white spokes photographed on Kodak S.S. Pan. film in a Baby Ikonta, with $f/3.5$ Zeiss Novar at full aperture. Microscopical examination of the developed negative showed that the lines lost their identity and merged into a uniform grey tone when their separation was about $1/500$ th in., and that much of the diffusion was due to grain.

Had a thin-emulsified film been used in a precision miniature I am sure that $1/1,000$ th in. would have been resolved.

My Zeiss catalogue states that the $f/3.5$ Tessar is superior to the Novar by $\frac{1}{2}$ ds. and I should expect from it an even higher standard of definition.

Apparently the claims made for miniature lenses are very modest.—Yours, etc.,

OWEN TUDOR.

(Johannesburg.)

PERFORMANCE OF CHEAP CAMERAS.

SIR,—Mr. Allinson writes from Switzerland to advise me to visit Messrs. R. F. Hunter Ltd. and see some large prints from Rolleiflex negatives. I am not easily able to do so, but have seen wonderful prints from these cameras before, but *not* taken at full aperture.

I am a perfectly ordinary amateur who does general work. I am attracted by a large lens and coupled range-finder or other device for enabling the lens to be used at full aperture. I want at times to take snaps inside theatres, sports meetings, and the like, and as I do not specialise in these I want a camera larger than *ciné* size. I have tried out so very many and not finding a good one turned me towards calculating the tolerance, and this showed me how very exact the construction has to be and explained why none of them are reliable.

As I am not arguing for the love of it, I ask any dealer who wants to make a sale to advise me if he has a camera in stock of the twin-lens or coupled range-finder type (the latter preferred), taking $3\frac{1}{2} \times 2\frac{1}{4}$ or $2\frac{1}{4}$ square pictures, which he can demonstrate can be fixed on a tripod or table and a film exposed preferably on some printing, as follows: The whole spool to be exposed on at least four varieties of distance at an aperture of not less than $f/3.5$, and all negatives without exception are to show sharp prints when enlarged four diameters. I should much like to buy such a camera and have given up trying to find one.—Yours, etc.,

R. E. DICKINSON.

FRONT-CELL FOCUSING.

SIR,—The following experiments I recently made with lenses focussing by the front cell method may be of interest to other amateurs.

Being dissatisfied with the definition given by the lens in my camera—an inexpensive one of aperture $f/2.9$ —I resolved to test it. This was done by fixing a ground glass in the back, setting a $7\times$ magnifier so that it was exactly focussed on the ground glass surface, and examining through the magnifier the image of a page of print of different sizes set up at varying distances from the lens.

The front cell focussing scale was found to be correct at 5 ft. at full aperture, but on stopping down to $f/4$, $f/5.6$, $f/8$ and

$f/11$, it was found that to get the clearest image possible the front cell had to be screwed out a little farther for each reduction of the aperture, the position for $f/11$ being the focussing mark for about 3 ft. 6 in.

The same thing applied, to a lessening degree, for distances of 7 ft., 10 ft. and 13 ft., becoming negligible at about 20 ft.; at 10 ft., $f/11$, the clearest image being obtained at the 8-ft. setting.

Bemoaning my stupidity in buying a camera with such a cheap lens, I hied me to Town and purchased another with one of the best lenses obtainable, of aperture $f/4.5$, and, out of curiosity, I put it to a similar test, with exactly the same result, to a lesser degree. (Focussing in this second case was also by screwing out the front cell.)

I therefore came to the conclusion that screwing out the front cell of a lens for focussing caused increasing spherical aberration, and the following test, I think, proves this.

The lens was focussed on the same page of print at about 5 ft., at the full aperture, and the clearness of the image noted (print below a certain size was quite unreadable); the front cell was then screwed right in to the infinity position (its proper position for perfect correction), and the ground glass, with the magnifier focussed on it, was gently moved back until the image was formed on its surface.

The difference was truly remarkable, print of the most minute size could clearly be read, and only the roughness of the ground-glass made a limit to the definition of the image.

Thus, apparently even with the best lenses, helical focussing cannot give pin-point definition at distances below about 15 ft.; only radial focussing, or systems in which the whole lens screws in and out avoid causing aberration (this refers, of course, to apertures above $f/8$). Trusting that you will find room to reproduce this rather lengthy letter.—Yours, etc.,

T. D. CROOK.

REVERSE SPOOLING.

SIR,—A recent correspondent comments on the advisability of British camera manufacturers incorporating the idea of "reverse spooling" or a second winding spool to enable a half-finished roll film to be removed for the use of plates, etc., before the idea comes over from Germany.

I should think the British manufacturers must have heard of, and seen, it years ago, as I have a combined $\frac{1}{4}$ -pl. plate and roll-film camera fitted with two winding spools which I bought as far back as 1909, and am still using it.—Yours, etc.,

CHAS. W. K. DALTON.

SIMPLE CAMERA DESIGN.

SIR,—Those of your readers who are old enough to have done hand camera work some thirty-five years ago will probably remember the "Xit" cameras made by J. F. Shew & Co. These instruments were of such remarkably compact, simple and efficient design that I think they might well be resuscitated in a more modern guise.

The "Xit" camera had the great merit of a really good rising front, and this without any added complication. The lens was focussed (as a whole) by a focussing flange, fitted with a distance scale.

The camera was, so far as I remember, meant for use with plates in dark slides, the roll film of to-day being at that time very much in its infancy; the design, however, readily lends itself to present-day film practice.

An instrument of similar design, but using modern light alloy die-castings and stampings, and made to take the popular $2\frac{1}{4}$ -in. square picture, would permit of full advantage being taken of the rising front for architectural work.

The folding film cameras of to-day suffer from a multiplicity of pin-hinged joints, folding struts, etc., all necessitating extreme care in manufacture and assembly if true coincidence of the lens focal-plane and film is to be attained. All these

Letters to the Editor—(continued)

joints, necessarily of somewhat light construction, tend to wear in use, with a resultant loss in focal accuracy. In the "Xit" camera there were only two hinges (on the wings supporting the lens front in the open position) and these had such long bearing surfaces that wear was quite negligible.

The extreme simplicity of this design would greatly assist factory adjustments, and once accurately made, these should remain so, even after years of use of the camera.

A modern edition of the "Xit" for a 2½-in. square picture would need a lens of fully 4 in. focal length, to give the extra covering power necessitated by the rising front when used. Any good f/4.5 anastigmat with such a shutter as the "Klio," and mounted in a focussing flange with a well-graduated distance scale, would meet all reasonable requirements. I must confess to having considerable doubts as to the desirability of the widely used "front cell focussing" of highly corrected lenses; it is, I think, a compromise policy dictated mainly by the requirements of coupled range-finders.

The unusually long focus lens for a 2½-in. square picture would, as an incidental advantage, tend to improve "perspective."

I venture to think that a camera such as I have suggested above might be appreciated by those who value simplicity, strength, efficiency and long-lasting accuracy above ultra-lightness and compactness. A separate range-finder mounted on the body would be a very useful addition, and this, combined with a fully graduated focussing scale and an accurate optical

view-finder, would provide an instrument capable of tackling practically any subject within reason.

If the rising front were graduated at two or three points in terms of picture width, a little practice would soon enable the user to estimate with reasonable accuracy the effect of its use; alternatively, a specially designed finder might be provided.—Yours, etc.,
D. F. NICHOLL.

CONTACT OR ENLARGEMENT?

SIR,—The delightful letter from (I am sure Miss) Dolly Varden in your issue of November 24th is good reading. Trudging along the open road "with a wind on the heath," carrying a half-plate outfit with three double dark slides, she evidently seeks strength and encouragement from Newman's hymn, "Lead Kindly Light." Doubtless she needs all the strength she can get to cheer her dragging footsteps burdened with such a load. There are two lines in the same hymn which aptly describe the half-plate enthusiast: "I am far from home," and "One step enough for me." Surely it is the miniaturist, free and unburdened, who rejoices in "the fell, the glen, the moor, the fen, the crag and torrent" (to quote from her letter).

Years ago I advertised my half-plate outfit with three double dark slides, but I could not get enough to pay carriage on it, and to-day it is somewhere in the garage along with my push-bike and the family perambulator. I think I will look it out and offer it to "The A.P." to be given as a prize for the best contact print.

With all good wishes for your splendid paper.—Yours, etc.,
A. T. WALLIS.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, December 22nd.

Darlington C.C. Exhibition of "Outings Prints Competitions."
Dennistoun C.C. Visit to "Daily Record." Foreign Portfolio.
Hinckley and D.P.S. "The Amateur Photographer" 1937 Prize Slides.
Mountain Ash C.C. Beginners' Mistakes—general discussion.
Northallerton and D.P. and Ciné S. Leeds C.C. Portfolio.
Partick C.C. G.D.U. Portfolio.

Thursday, December 23rd.

Blyth and D.C.C. Enlarging Demonstration for Beginners.
Coatbridge P.A. Scottish Photo Circle Portfolio.
Hampshire House P.S. "Light Filters and their Uses." J. Ainger Hall.
Hull P.S. Question and Answer Evening.
Kinning Park Co-op. C.C. G.D.U. Portfolio and S.P.F. Foreign Portfolio.
Oldham P.S. 1937 Competition Prints.

Friday, December 24th.

Exhibitions and Competitions

CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, December 31. Rules in issue of November 24.
Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.
Winter Snapshot Competition for users of the Purma Special Camera. £100 in cash prizes.—Particulars and entry forms from R. F. Hunter Ltd., 51, Gray's Inn Road, W.C.1.
Bertram Mills' Circus Competition.—Cash prizes for photographs taken during the performances from December 22 to January 25. Extra prizes for winning prints by readers of "The A.P." Particulars in "A.P." dated December 8.
International Photographic Exhibition in Debrecen (Hungary).—Open, January. (Aszmann Ferenc, Ferenc Josef ut, 27, Debrecen, Hungary.)
XIIe International Fotosalon "Iris."—Open, January, 1938. (F. Geeraerts, Brederodestr, 22, Antwerp, Belgium.)
Preston S.S. (P.S.) Thirteenth Annual Open Photographic Exhibition.—Entry forms, January 7; exhibits, January 14. (F. Wells, 65, Powis Road, Preston, Lancs.)
Second Indian International Salon of Photographic Art.—Entries, January 15; open, March. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)
Aberdeen P.A. International Exhibition of Photographic Art.—Entries, January 15; open, February

5-26. (Miss Hilda M. Bailey, 63, Watson Street, Aberdeen.)
Stockton-on-Tees and D.C.C. First Annual Salon of Photography.—Entries, January 15; open, February 7-9, inclusive. (J. Greenwell, 9, Birkley Road, Norton-on-Tees.)
Nottingham and Notts P.S. 34th Annual Exhibition.—Entries, January 21; open, February 7-12. (T. G. Earp, 14, Brushfield Street, Hyson Green, Nottingham.)
Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21-March 12. Last day for entries, January 29. (H. Foscutt, 19, Doncaster Road, Leicester.)
Ilford P.S. International Exhibition of Photography.—Entries, January 31; open, March 7-12. (H. D. J. Cole, 11, Woodlands Road, Ilford, Essex.)
L.M.S. (London) P.S. 13th Annual Exhibition.—Entries, February 1; open, March 7-12. (Hon. Exhibition Secretary, L.M.S. (London) Photographic Society, 1, Euston Square, London, N.W.1.)
Birmingham P.S. 47th Annual Exhibition.—Entry forms, February 3; exhibits, February 5; open, February 26-March 12. (E. H. Bellamy, 20, Waterloo Street, Birmingham, 2.)
City of London and Cripplegate P.S. Thirty-third Annual Photographic Exhibition.—Entries, Monday, February 7; open, March 7-12. (R. C. Dye, The Flats, Chesham Road, Wigginton, Tring, Herts.)
Southampton C.C. Open Exhibition.—Entries February 14; open, February 28-March 19. (Cecil

Chandless, Fcn. Exhibition Sec., Southampton C.C. 30, Carlton Crescent, Southampton.)
Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23-26. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)
Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April. (Hon. Exhibition Secretary, H. V. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)
Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9-April 2; entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

An evening class for photography will be held again at the Cripplegate Institute, Golden Lane, City. The instructor will be Mr. John H. Gear, and the Winter Session will commence on Wednesday the 5th January next. The syllabus deals with subjects important to all interested in photography, whether amateur or professional. We understand there will be a few vacancies only, therefore early application should be made as the number is limited. Work throughout the entire three months' course will be fully demonstrated.

A Tempiphot Exposure Meter, No. 628994, has been stolen in Birmingham from one of our readers, Dr. Zair, 28, Broad Street, Ludlow, who will be pleased to receive any information regarding the stolen article.

The Photo-Guide booklets, published at 1s. 1d. each by Messrs. Sands Hunter and Co., Ltd., each deal with some one aspect of photography in a simple and fully explanatory manner. Many beginners must have found the earlier members of this series of the greatest possible help in their hobby, and they will quite certainly welcome the four booklets just added to the series. These bear the titles "How to Enlarge," "Vivid Portraits," "Light Filters," and "Action Snapshots." Each of them is an excellent elementary treatise on its own subject, and all are written in simple language and discuss their respective topics in a very lucid and helpful manner. They are authorised translations of the German "Fotorat" series, which has achieved tremendous popularity in its own country, and if one may judge by the English versions that popularity is well deserved. The Photo-Guide booklets can be obtained through any dealer, or direct from Messrs. Sands Hunter & Co., Ltd., 37, Bedford Street, Strand, W.C.2.

The prize-winners in Johnson's "Holiday" Competition have just been announced: Five First Prizes of £5 each were awarded to: T. D. Miller (Sunderland), Miss Brenda Girvin (London, S.W.1), Arthur G. Bishop (Bristol, 4) C. K. Richmond (Bristol), and Mrs. D. E. Newham (Scarborough). Five Second Prizes of £2 each were awarded to: J. Turner (Pickering), G. W. Perkin (Wakefield), Herbert E. Smith (Southsea) T. F. Holdsworth (Wakefield), T. Mathison (Bedford). Ten Third Prizes of £1 each awarded to: T. R. Clemo (Kew Gardens, Surrey), R. V. Husted (Hounslow), E. Richardson (Bridgford), R. L. Shaw (Pickering), Miss Dorothy Colles (Leatherhead), G. C. Backhouse (Leeds, 8), John Cameron (Dundee), Mrs. F. W. Wyand (Ovingham-on-Tyne), George Crick (Liverpool, 5), A. G. Dell (W. Norwood). Thirty Fourth Prizes of 10s. each were also awarded,

and fifty consolation prizes. A full list of the names and addresses will be sent on application to Johnson & Sons, Hendon Way, Hendon, N.W.

The Cyclists' Touring Club West Kent District Association is organising a photographic competition for beginners and advanced workers the closing date for which will be January 31st, 1938. Full particulars and entry forms are obtainable from the Hon. Secretary, Mr. L. H. Cullingford, 115, King Harold's Way, Bexley Heath, Kent. The competition is open only to members of the West Kent District Association.

Messrs. Newman & Guardia, Ltd., manufacturers of the famous "N. & G." cameras, advise us that Mr. T. Woollett has now been appointed to the Board of Directors, and Mr. J. V. Burford has succeeded him as works manager.

"Round the Clock with Zeiss Ikon Cameras" is a new booklet describing the Nettar, Ikonta, Super Ikonta and Ikonflex cameras, as well as the whole Zeiss Ikon range of miniatures and the Movikon 8-mm. and 16-mm. ciné cameras. The title of the booklet is derived from the fact that the various pictures reproduced show that many of the cameras described can be used for taking good pictures not only on every day of

the year, but by night as well. As full details of the cameras are included, together with those of the more important accessories for each, this new publication constitutes an up-to-date catalogue of the Zeiss Ikon cameras. It can be obtained free from any dealer, or post free on application to Messrs. Zeiss Ikon Ltd., Maidstone House, 25-27, Berners Street, W.1.

The Birmingham Photographic Society have sent us a current copy of their "Journal," which is as usual full of interesting reading. The Society is to be congratulated upon the production of so complete a publication, as in addition to a very full calendar of events they publish a complete list of all their members, and also a copy of their balance sheet.

A Photographic Society has been formed to cover the Windermere, Bowness and Ambleside area, known as the Windermere and District Photographic Society. Amateurs, ladies and gentlemen, are invited to apply to the Hon. Secretary, Mr. T. T. Mycock, Oak Howe, Windermere, for information regarding the Club, and for particulars of meetings, at which they will be welcomed.

This week's prize-winner in the Wallace Heaton "Speed and Action" competition is Mr. J. Poppleton, Holly Glen, Lacey Road, Grimsby, to whom an award of one guinea has been made. Full particulars of these weekly competitions for readers of "The A.P." appear regularly in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 3 x 5, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½ x 3½ x 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

105. Makers' Formulæ: Developers for Gevaert Lantern Plates

G251. Normal M.Q.

Metol	13½ grs. (1.5 grm.)
Sodium sulphite (anhydrous) ..	220 grs. (25 grm.)
Hydroquinone ..	54 grs. (6 grm.)
Sodium carbonate (anhydrous) ..	360 grs. (41 grm.)
Potassium bromide ..	9 grs. (1 grm.)
Water to	20 oz. (1,000 c.c.)
If crystallised sulphite is used, take 440 grs. (50 grm.). If crystallised carbonate is used, take 850 grs. (100 grm.).	

Normal time of development for lantern plates, 1½ to 2½ minutes at 65° Fahr. (18° C.).

This is the Gevaert general-purpose developer, suitable for the development of printing papers of practically every type, including Gevalux. It may if necessary be diluted with its own bulk of water, which lengthens the period of development, or, if the normal time is retained, softens contrasts.

G253. Soft-Working M.Q.

Metol	27 grs. (3 grm.)
Sodium sulphite (anhydrous) ..	180 grs. (20 grm.)
Hydroquinone ..	9 grs. (1 grm.)
Sodium carbonate (anhydrous) ..	165 grs. (18.5 grm.)
Potassium bromide ..	9 grs. (1 grm.)
Water to	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take 360 grs. (40 grm.). If crystallised carbonate is used, take 440 grs. (50 grm.).

This developer gives softer results than G251, and lantern plates should be developed in it for 1 to 2½ minutes at 65° Fahr. (18° C.). It may if necessary be diluted with its own bulk of water, which increases the time of development.

This developer is also suitable for soft results on Gevaert printing papers, including Gevalux.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Pinholes.

The enclosed negative, developed by a commercial firm, has a number of clear specks on it. Can you tell me how these arose? If I developed my films myself should I get as good results as by having them done for me?

A. S. R. A. (Cambridge.)

The spots on your negative are what are known as pinholes, and are due to dust on the surface of the film during exposure. You must take every care to keep the inside of your camera quite free from dust. There is no reason why you should not very quickly learn to develop your own films quite as well as they are done by the average professional firm, but for the best and most certain results we would strongly recommend you to invest in a tank for the purpose.

Lamp for Enlarger.

I have just built an enlarger, and would be obliged if you could tell me what type of electric lamp to use. Is there any made specially for the purpose with low emission of heat?

W. S. H. (Southampton.)

It is usual to employ for enlargers ordinary household lamps of about 60 watts. The amount of heat generated depends only on the wattage of the lamp, and not on its make or type.

Hyperfocal Distance.

I have an Ensign Selfix camera fitted with a 100-mm. Ensign lens of aperture f/4.5. Would you please tell me the hyperfocal length of this? When focussed for this distance, from what distance to what distance will objects be in focus?

F. D. (Bristol.)

If you refer to pages 12, 13 and 14 of "The A.P." Diary for 1938, now on sale at 1s. 6d., you will find full instructions for calculating both hyperfocal distances and depth of focus at any setting of the focussing scale. For a moderately high standard of definition—but not the highest—the hyperfocal distance of your lens would be roughly 70 ft., and when the scale is set to this objects from 35 ft. to infinity would be reasonably sharp.

Photographing in a Mirror.

Recently I took a photograph of a reflection in a mirror, carefully measuring the distance from camera to mirror and setting my focussing scale to correspond. Yet the picture is very badly out of focus. Can you tell me why?

M. V. S. (London.)

You do not say whether your photograph included the frame of the mirror; if it did, that frame should be sharply rendered, but the image you were trying to photograph certainly would not be. The reason for this is that the image does not lie on the surface of the mirror as though it were painted on the glass, but is behind it. You can prove this for yourself by holding a small mirror, inclined at an angle, an inch or less from your eye. Though your eye could certainly not focus anything as close as that, you will still see a perfectly clear image of the objects reflected, proving that the image is much farther away than the surface of the mirror. Actually it is as far behind the glass as the object reflected is in front of it. In photographing a reflection you must therefore measure the distance from camera to mirror, and the distance from mirror to object, add these two distances together, and set your focussing scale to the total distance so obtained. Your picture should then be sharp, but the frame of the mirror will of course be blurred.

Gum-Bichromate Printing.

Can you tell me where I can get a handbook on the gum-bichromate process, and where I can buy the sensitised paper for it?

A. J. R. (Surrey.)

We know of no book now in print dealing with the gum-bichromate process only, although the matter is dealt with in various textbooks, such as the "Dictionary of Photography." You cannot buy the paper required, as all workers of this process prepare their own.

Re-Silvering.

Can you give me the name of a firm who would re-silver the mirror of my reflex? Mine, new eighteen months ago, is already badly tarnished through the perishing of the lacquer. Would not a chromium-plated metal mirror serve equally well? It would certainly last better.

H. E. S. (Birmingham.)

There are several firms who will re-silver a mirror for you, and one of your local photographic dealers can get the work done. Alternatively, you could return your camera to the makers and let them carry out the work. Reflex mirrors are generally silvered on the surface so as to avoid double reflection, and are varnished afterwards. Such a mirror ought to last much longer than the time you mention. We know of no reason why chromium-plated metal mirrors should not be used, but we have never heard of this being done.

Finding Focal Length.

Will you please tell me how I can find the focal length of a lens? S. V. (Weymouth.)

You can get a fairly close approximation to the focal length of a lens by focussing sharply on a very distant object, and measuring from the back of the lens to the screen in the case of a single lens, or from the diaphragm to the screen in the case of a compound lens. If your camera has extension enough, or if you can rig up some temporary arrangement, you can get a still closer approximation by focussing a small object so that it is reproduced *exactly* full size on the screen. The focal length will be almost exactly one-quarter of the distance between object and focussing screen. The most exact method of all is to focus first the distant and then the near object as described; the extra lens-to-screen distance required for the near object, over and above that needed for the distant one, will be the exact focal length of the lens.

Copyright in a Window.

Recently I took a photograph of a memorial window in a church, erected by members of his family in memory of a soldier. This photograph having come out well, I should like to submit it for publication. If I did so, should I be breaking any regulations concerning copyright?

H. K. (Sheffield.)

We would strongly advise you not to publish the photograph you have taken without getting permission from the persons who had the window produced for them. You should also get permission from the rector, or vicar, in charge, who will doubtless be able to put you in touch with the people who gave the window to the church.

Safelight for Bromide Paper.

I have read of bromide paper being developed by a yellow light instead of a proper dark-room lamp. If this is safe, can you tell me where I can get the necessary yellow filter?

I. B. (Bolton.)

A yellow safelight is generally used for bromide work, and you will find it a great deal more comfortable to work by than the deep red light you have apparently been using. Any dealer can supply you with a suitable safelight, but you should make sure you let him know what kind of lamp you use.

Buy from R. G. LEWIS (CINÉ) "THE CINÉ SPECIALISTS"

We reiterate that, as far as we know, R. G. Lewis (Ciné) is the only firm in Great Britain specialising exclusively in the sale of Amateur Cinematograph Apparatus. The specialist concentration policy that we pursue means for you a better deal. Our service is better than can be obtained elsewhere and the high part exchange allowances for which we are particularly noted ensure that your contact with us is always friendly. We have a staff of trained experts who are always ready to give you their opinions on any piece of apparatus and who will instruct you in the use and maintenance of your equipment. (It has occurred to us that a simple explanation of the word "Specialist" would be appropriate. A specialist is one that devotes himself to a particular branch of a profession, science or art).

SOUND-on-FILM PROJECTORS:

Gebescope Model B, with dual loud speakers for D.I.N. or S.M.P.E. film, complete in and perfect order, with manufacturer's guarantee. £29 0 0
Amprosound Model M, 500-watt lamp, detachable A.C. D.C. amplifier, output 8 watts, 10-in. loud-speaker, complete in two carrying-cases. In as new condition. £29 0 0
Victor Animatophone, 500-watt lamp, special film trip action, also for silent films, 5 watts output. Excellent condition £27 10 0

16-mm. SILENT PROJECTORS:

Siemens Standard Projector, bronze finish, built for commercial use and will stand any amount of hard wear, 250-watt lamp, fan cooling and ammeter, stills device, motor rewind with resistance and travelling case. As new £45 0 0
Siemens Standard, black model, 200-watt lamp, otherwise as above. Good condition. £35 0 0
Ampro Model J.D., 500-watt lamp, reverse, still picture device, Ventura cooling system, separate lamp switch, high-speed motor rewind, with case. As new. £33 10 0
Ampro Model K.D., 750-watt lamp, specification as above, but with large diameter lens and built-in pilot light, with case. £39 0 0

Kodascope Model C, 100-watt lamp, complete with resistance. Good condition £17 6
Zeiss Kinovox, 800-ft. model, 375-watt lamp, fan cooled, totally enclosed, very silent, complete with transformer. Perfect condition £22 10 0

DUAL PROJECTORS:

Ditmar Duo for 8-mm. and 9.5-mm. films, 500-watt lamp, stills, reverse, illuminated panels for threading in the dark, with resistance. As new £29 10 0
Bolex G916, for 9.5-mm. and 16-mm. films, 500-watt lamp, reverse, stills, complete with spare parts and resistance. Very good order. £31 10 0
Siemens Sixteen-Nine, Beta film movement, ammeter, 250-watt lamp, 35-mm. Dallmeyer lens, built-in resistance, case. As new £47 10 0
Bolex D.A., for 9.5-mm. and 16-mm. film, will show notched films, reverse, stills, 40-mm. Meyer Kinon lens, with resistance. Very little used. £23 10 0

9.5-mm. PROJECTORS:

Bolex-Paillard P.A., 400-watt lamp, reverse and stills, motor rewind, 35-mm. lens, with resistance. £19 10 0

Coronet Model II. Very nice condition. £6 17 6
Pathe Imp. one-amp model, motor, super attachment, resistance. Good condition. £4 12 6

8-mm. PROJECTORS:

Eumig P.III, 250-watt lamp, 25-mm. Meyer Kinon lens, motor rewind, quick-feed sprockets. As new. £14 10 0

CAMERAS:

16-mm. Zeiss Movikon, f/1.4 Zeiss Sonnar lens, coupled focusing, 4 speeds, hand crank, adjustable shutter sector, visual inspection aperture and many other features, with case. As new. £77 10 0
16-mm. Zeiss Movikon, as above, but not such nice condition £67 10 0
16-mm. Paillard Bolex Model 16H, turret head, visual focusing, self-threading, 1-in. f/1.5 Dallmeyer Speed lens and leather case. As new. £39 0 0
9.5-mm. Pathe de Luxe, f/1.5 Hugo Meyer lens, with carrying-case. £19 17 6
8-mm. Bell & Howell Straight Eight, speeds 8, 16, 24 and 32, f/2.5 T.T. & H. lens, case. £9 17 6

A Charming Gift for Art Lovers

PHOTOGRAMS OF THE YEAR

THE ANNUAL REVIEW OF THE WORLD'S PICTORIAL PHOTOGRAPHIC WORK
Edited by F. J. MORTIMER, Hon. F.R.P.S. Editor of "The Amateur Photographer and Cinematographer"

"Photograms of the Year" has grown in popularity with the passing years. The volume for 1938 is the forty-third annual issue and will increase the prestige which this outstanding compilation has won throughout the world for its wide range of subjects, their technical excellence, and the quality of reproduction. It contains examples of the best work of the world's foremost camera artists, specially chosen by Mr. F. J. Mortimer, Editor of "The Amateur Photographer." Keen photographers will welcome the opportunity afforded by "Photograms" of viewing the finest and most modern expressions of photographic art, and of observing the latest technical developments.

**NOW ON
SALE**

The volume contains an editorial résumé on "The Year's Work," and contributions by well-known writers in many foreign countries. Critical notes of the photographs, and an up-to-date Directory of British Photographic Societies are also included.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less..... 2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

IMPORTANT NOTICE

Owing to the Christmas Holidays, next week's issue of "THE AMATEUR PHOTOGRAPHER" (dated December 29th) has gone to press earlier than usual. In accordance with the notice that appeared last week only those MISCELLANEOUS ADVERTISEMENTS which have already been received can be inserted in next week's issue.

CAMERAS AND LENSES

NEGRETTE and ZAMBRA, 122, Regent St., W.1. Camera Specialists, offer the following bargains; all apparatus guaranteed and sent on 5 days' approval against full deposit; maximum allowance for saleable apparatus, either exchange or cash; our reputation your guarantee.

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

"HALIE" RETOUCHING OUTFIT

For glossy or matt prints, negatives and lantern slides.
PRICE, complete with instructions, 4/-. Postage 3d. extra.

"HALIE" DRY COLOURS

For tinting rough, matt, or semi-matt bromide prints.

CARTON S (dull shades primarily for overtoning).
CARTON G (strong colours primarily for tinting).
Each 5/-. Postage 3d. extra.

"HALIE" TRANSPARENCY FRAMES

A practical and economical method of mounting 24x36 mm. colour and monochrome transparencies for lantern projection.
Per box of 20, Price 10/-.

"HALIE" PRINTING SCREENS

The etching screen gives enlargements or contact prints a characteristic and unique appearance: soft, irregular and very plastic. The size and width of the lines increase progressively with the size of the screen, so that the image character appears the same when prints of various sizes are viewed from their proper distances. All sizes are provided with an opaque border, giving a white margin to the print or enlargement.

In addition we have all the best projectors, including Specto, Dittmar, Eumig, Pathe Ace, Pathe H, B-200, Illustra, and many others. THESE include many exceptional offerings, and therefore your inspection is invited. Our stock will amaze you.

WE offer films of every description, 9.5-mm. subjects, such as Popeye, Mickey Mouse, Charlie and all the favourites; 16-mm. and 8-mm. items in which Shirley Temple and many popular stars appear; Standard Films from 6/- until 8.

ILLUSTRA ENTERPRISES, 159, Wardour St., London, W.1 (Oxford Street End, facing Gaumont's), not merely a shop but a warehouse packed with movie equipment to suit your requirements. [1123]

Here's wishing you "All the Best" from The Service Coy.
Your Photographic and Ciné Dealer.

THE ROLLEICORD

6 x 6 cm. ROLLEIFLEX for 12 pictures on usual 3 1/2 x 2 1/4 spool becomes more than ever automatic, with optical and mechanical perfection. Lens is f/3.5 Tessar with Compur Rapid shutter, speeded to 1/500th sec. **£31:5:0**
24 monthly payments of 27/4.

This instrument needs little introduction. Takes 6 x 6 cm. pictures (12 on 3 1/2 x 2 1/4), f/4.5 Zeiss Triotar lens, Compur shutter, automatic numbering device with film stop.

£12:10:0
Or 18 payments of 14/10 per month.

The NEW ROLLEIFLEX**A PAILLARD-BOLEX PROJECTOR for 26/9 per month.**

Specification.—Shows both 9.5 and 16 mm. films. Price includes resistance and 400-watt lamp. Flickerless projection ensured by special shutter giving three observations per picture. 400-watt projection lamp with double row of filaments gives brilliant pictures on screens up to 6 ft. or 8 ft. wide. "Still" pictures for any length of time, instantaneous reverse projection (shows motion backward), rapid motor rewind and many other refinements. 400-watt lamp and Meyer f/1.6 40-mm. lens, with resistance **£29:17:6**
Or 24 equal payments of 28/9 per month.

**The NEW PATHESCOPE 'H'**

This new outfit for real motion pictures in the home is for the projection of 30-ft., 60-ft., 200-ft. and 300-ft. reels. The "H" is solidly built and is for use on all alternating current mains from 200 to 250 volts, 40-60 cycles. The "H" is motor-driven through a transformer in the base, sprocket fed and ensuring steady, correctly centred pictures with direct and brilliant screen illumination from a 100-watt lamp. There is also a semi-automatic shutter for film protection during threading **£10:10:0**
Or 18 equal payments of 12/6 per month.

**—ENLARGERS—**

All models, vertical and horizontal. From £2 upwards. Extended Terms.

FAX

The New enlarger, which we offer you, has all the features you have needed for some time, and many additional ones.

- 1.—Extremely rigid three-part upright column without the slightest "play" in it.
- 2.—Ultra-fine focussing by a new revolving friction pressure non-tooth wheel, operated by large hand disc control.
- 3.—Unique swing, tilt, lower, or higher lamp adjustment, to get lamp centred over any "part" of a negative.
- 4.—Swinging upright, to enlarge to the floor.
- 5.—Revolving lamphouse, to use as a horizontal enlarger, or as a projection lantern, with interchangeable lantern lens.
- 6.—Tilting device, for correction of perspective, such as buildings "falling over," etc.

Other special features include: Double condensers, interchangeable lenses (take any camera lens, such as Contax, Leica, Exakta, T.P., etc.), height adjustment of lamphouse by ultra-fine friction wheel, controlled by large hand disc wheel, ground-glass diffuser interchanging, automatic opening lamphouse, vertical raising, which holds the carrier and film in perfect register on operating. Full range of masks enlarging from Leica to $3\frac{1}{2} \times 2\frac{1}{4}$ (or 6×6 respectively), 100-watt illumination, hinged orange cap with locking device, baseboard 16×16 in.

Prices, complete with f/4.5 anastigmat, iris diaphragm, orange cap, set of metal masks, special auto-opening carrier, flex, switch and plug.

$3\frac{1}{2} \times 2\frac{1}{4}$ £16:16:0 6×6 £15:15:0

Note.—We have the confidence that this enlarger has no competitor in such movements and ideal features. In our experience, there has been nothing like it on the market.

APPROVAL.—Such is our confidence that we will send either model on free trial against remittance (or deposit "A.P.")

WRITE NOW!

**SENSATION OF THE ENLARGER WORLD.
GUARANTEED TWO YEARS.**

THE PERFECT "TALKIE"

16-mm. De Vry Sound Projector has the unique intermittent "no-claw" film drive of 35-mm. cinema design (film driven by rotation sprocket always in edge contact, no push in and out as claws), double exciters (the only 16-mm. machine with patent twin exciters—slide one in position if other fails, without stopping the show), swing-up reel arms (no screwing or clamping), illuminated controls (seen in the dark), real ball-bearing idler rollers, full-size 35-mm. sound head (for purity), large component "long-life" amplifier, in special separate "balanced weight" carrying-case, 750-watt direct illumination via 2-in. diameter condensers, and 8-watt (37-watt peak) amplifier..... £148:0:0

Also the famous De Vry 35-mm. Portable Projectors, 35-mm. Theatre Projectors, Sound Cameras, Sound Printers, manufacturers of the largest and most complete range of cinema apparatus in the world.

Why not get a home ciné projector on easy payments spread over one or two years? Confidential, no harsh enquiries, anything taken in exchange. Wallace Heaton Ltd. or City Sale and Exchange (1929) Ltd.

"Gnome" Electric Negative Viewer...

for 24x36 mm. colour films or positives from miniature negatives up to 5x5 cm. The viewer is designed to take a 15-watt bulb and will accommodate either strip film or single negatives which may be conveniently and easily mounted in the "Gnome" Transparency Frames. The "Gnome" Negative Viewer gives a four-times magnification, and also an exceptionally fine stereoscopic effect to coloured films or ordinary transparencies. Price (excluding bulb).....**£3:7:6**

"GNOME" METAL TRANSPARENCY FRAMES, 5x5 cm.

A convenient and simple method of mounting 24x36 mm. colour films or positives for projection purposes and having the advantage that the film is readily interchangeable. A special mark is supplied ensuring the exact centring of the film negative. Price, 12/6 for 25, complete with glasses and masks.

PHOTO - GUIDE No. 5—HOW TO ENLARGE

This new Photo-
Guide tells and
shows what is of
enlarging possi-
bility, which part
of the negative to
choose, how the
enlarger is set
up, how to enlarge,
and some tricks in-
volved. Fine
examples and
sketches help to
clear up all en-
larging prob-
lems.

PHOTO - GUIDE No. 6—VIVID PORTRAITS

It makes no dif-
ference whether
the snap is self-
made or taken
by a friend, there
is no picture
which gives so
much interest as
a portrait. All
that is abso-
lutely indispen-
sable in portrai-
ture is to be found
in the pictures
and rules in this
Photo-Guide.

Price 1/1, post-
age 2d.

VIVID PORTRAITS

PHOTO - GUIDE No. 7—LIGHT FILTERS

The filter is to
the camera what
spectacles are
to the eyes. This
Photo - Guide
makes it easy
to choose the
right filter for
the right film
according to the
subject to be
photographed,
also to calculate
the correspond-
ing exposure
that is needed.
Price 1/1, post-
age 2d.

PHOTO - GUIDE No. 8—ACTION SNAPSHOTS

This Photo-
Guide gives us,
in telegraphic
style, directions
for all situations
and some fine
photographic
examples. The
modern photo
is a quick snap.
In the hurly-
burly of traffic,
at markets, play-
grounds or de-
monstrations,
sporting events
or in the theatre
there is nothing
to stop you from
pressing the but-
ton.

Price 1/1, post-
age 2d.

FLOODLIGHT REFLECTOR

FOR INDOOR PORTRAITS

This Floodlight Reflector can be used off any ordinary electric light system, no special wiring is necessary. The light given by a Nitraphot Lamp in conjunction with the Floodlight Reflector is extraordinarily intense; yet it is soft and well diffused. Well-exposed negatives can be obtained with an exposure of 1/5th second with a lens aperture of f/4.5.

The light from a pair of these Floodlight Reflectors is sufficient for using a cine camera indoors. One Reflector used on a tripod can be adjusted to any height up to six feet, while a second Reflector can be placed elsewhere to balance light or shade as desired. With these Reflectors the light can be made to fall upon the subject from above, from below, or from the side, and enables the amateur to experiment with various modes of illumination in his own home.

FLOODLIGHT REFLECTOR.
Complete with switch, 9-ft. flex with wall plug and lamp-holder adapter. Price **25/-**.

Extra 9-ft. Extension Flex.....	5s. 0d.
Diffuser, extra.....	2s. 6d.
200-watt Nitraphot Lamp, 6,000 lumens, extra.....	7s. 6d.
500-watt Nitraphot Lamp, 11,000 lumens, extra.....	20s. 0d.

(Please state voltage when ordering.)

Nitraphot Exposure Meter.....	1s. 6d.
Metal Telescopic Tripod, with adjustable centre pillar; can be raised to 6 ft. Nickel-plated throughout.....	Price 25s. 0d.

FINAL**

ONLY THREE SHOPPING DAYS BEFORE CHRISTMAS

—SEE THAT NO-ONE IS FORGOTTEN!

We have photographic and ciné gifts to suit every taste and purse—your last-minute problem will be easily solved if you call at our showrooms. In addition to home talkies, movies, cameras and ciné cameras, we have a comprehensive range of the "little things that count," including camera cases, tripods, lenses, filters, editors, splicers, etc. Come to Bond Street for inspiration.

W. H. LEICA 'METACASE'

A light-weight pigskin case (no thicker than the normal over-ready case) which safely carries your camera with lens, Weston exposure meter and filter (or spare film). The meter is free for use as soon as case front and single back flap are opened. Camera is secured by tripod socket screw, while remaining accessories are enclosed in separate pockets.

PRICES:

To carry Leica 1, 11 or 11L with f3.5 lens... £3 0 0
Or with f2 lens... £3 3 0
Or f1.5 lens and lens hood... £3 12 6

W. H. CONVERTABLE TABLE TRIPOD

A combined tripod head and table tripod. Can be set for upright or horizontal pictures. Ample allowance for upright adjustment of tripod on uneven ground. The removable legs are fitted with unbreakable tips which will not mark polished surfaces. Tripod is adjustable between 2 in. and 8 in. in height. Price... £1 12 6

FILMO "8" PROJECTOR

Has most efficient direct lighting system with 400-watt lamp and f1.6 lens. Automatic rewind. 200 ft. film capacity.

Cash price **£41:0:0**

24 monthly payments of 38/9.

BUY THE NEW 8 and 16 mm. 'CASTLE' FILMS for your permanent library

THE BEST PRESENT OF ALL

Who wouldn't like a Leica? Why not treat yourself to one for Christmas. Your present camera may go a long way towards paying for it. Send it along for our part-exchange quotation.

Model IIIa (chromium), takes 36 exposures at a loading. Speeded to 1/1,000th sec., and fitted with f/2 Summar lens... **£43 0 0**
24 monthly payments of 38/7.

OR AN AUTOMATIC ROLLEIFLEX

The simple, speedy, twin-lens reflex camera. Shows pictures full size and right way up on the ground-glass screen. Takes 12 pictures on 8 exposure 35-21 roll film for 1" or may be adapted for plates on 35-mm. negatives. With f3.5 Zeiss Tessar lens and Compur Rapid shutter and many new automatic refinements... **£31 5 0**
24 monthly payments of 28/-.

W. H. TRAY-TYPE CAMERA CASE

Provides the answer to the old problem of where to set down the camera and accessories while changing lenses, etc. The tray case hangs round the neck in such a manner that it opens out to form a flat tray on which to place the camera in safety. The case is divided into separate compartments to take camera, exposure meter, lens hoods, filters, spools, etc. Price, in best pigskin (as illustrated)... **£5 12 6**

Send a list of your own equipment and let us quote you for a case to exactly accommodate it.

WRITE NOW FOR OUR NEW LIST OF MINICAM ACCESSORIES

This list does not contain cameras, but is a veritable mine of information regarding accessories for all minicams. It contains many recent useful introductions by Wallace Heaton Ltd.—no miniaturist should be without it; send 2d. postage now!

FILMOSOUND 138

Gives 45 minutes' show without a stop. In use, the combined projector and amplifier unit is removed from the case, of which the cover serves as the handle for the self-contained loud-speaker. Voltages on exciter lamp and photocell are balanced automatically. New type of tilt device. Motor rewind.

Cash price **£138:0:0**
or 24 monthly payments of 46/3s. 8d.

PATHESCOPE 'S' 9.5-mm. DE LUXE

For 300-ft. and 800-ft. reels of 9.5-mm. film. Sprocket fed. Non-commutator, synchronous motor ensures very smooth running at a speed of either 16 or 24 pictures per second. High efficiency, low voltage, high amperage 200-watt lamp (15 volts, 12 amps) and is transformer fed. 35 minutes' projection without changing reels. For A.C. mains from 110 to 250 volts.

Cash price **£30:0:0**

24 monthly payments of 36/11.

KODASCOPE "EE"

With handsome dual-purpose case, which also acts as a substantial vibration-proof base when the Kodascope is in action. There is also a 26-in. tilting device for accurate centring. Provided with 300-watt lamp. Models supplied for either A.C. or A.C./D.C. circuits. With 12 lens.

Cash price **£32:10:0**

24 monthly payments of 29/2.

BOLEX G916 PROJECTOR

For both 9.5 and 16 mm. films.

This machine is entirely gear driven, there being no belts whatever. With Dallmeyer 2-in. projection lens, including all accessories to project both sizes of film and 110-volt 500-watt lamp.

Cash price **£45:0:0**

24 monthly payments of 40/4.

Vol. LXXXIV.

Wednesday, December 29th, 1937.

No. 2564.

This Rolleiflex Picture

Successful sports pictures are notoriously difficult to obtain—as every photographer who has attempted them well knows. But so clever is the Rolleiflex in its design that the most difficult subjects can be taken with comparative ease. Notice in the above picture, the wealth of detail, the sharpness, the depth of focus—the expression of intense concentration on the goalie's face. It was the Rolleiflex which enabled the photographer to get all these. Chief amongst its many unique advantages are its deep reflex hood, focussing screen and magnifier, showing the picture right way up in actual size and permitting the most critical focussing in the shortest possible time. The easier controls, the magnified readings of the lens stop and shutter speeds seen through the peep window above the finder lens, are all designed for speed and ease of manipulation and allow the photographer to concentrate fully on his subject. Other important features are the automatic film wind, which in one action sets the shutter, prevents double or blank exposures and sets the built-in self-timer for delayed action (if desired). Rolleiflex takes 12 pictures on $3\frac{1}{2} \times 2\frac{1}{4}$ roll film for 1/-. The f/3.5 Zeiss Tessar and Compur Rapid shutter, speeded to 1/500th sec. and Bulb, are equal to the most exacting demands of light and speed. Price £31 5 0.

Ask your dealer to demonstrate, or write for Rolleiflex/Rolleicord brochure and name of nearest stockist from the Sole Importers:

KODAK

NEWS

What every 'A.P.' reader ought to know about Home Movie Film

Two films were given a range of exposures varying from $f1.9$ to $f16$. The first was processed without compensating exposure and reveals wide differences in density. The second was processed by the Ciné-Kodak exposure-compensating system and shows remarkable evenness of density despite great differences of exposure.

In addition to the fact that the thoroughly comprehensive range of Ciné-Kodak Films provides a grade appropriate to every cine purpose—from the filming of baby on the lawn to an amateur photo-play in colour—there are other powerful arguments in its favour.

Ciné-Kodak Film is Reversal Film. In the course of processing, the negative image, formed from the larger grains of silver salt, is bleached out, leaving only the minute unexposed grains to form the positive image; i.e., Ciné-Kodak Film gives you a **finer-grained, clearer** screen image than non-reversal films of similar speed can possibly do.

With "Kodachrome" there is actually no grain at all in the processed film, the final image consisting only of pure transparent dyes.

Then again, those deviations from the theoretically correct exposure that are bound to occur from time to time are **automatically compensated for** during the processing of black-and-white Ciné-Kodak Film by a photo-electric cell device exclusive to Kodak. A substantial margin of error is thus permitted, and screen results are practically constant in brightness, quality and detail. (See illustration on left.)

From Ciné-Kodak Dealers, or write to Mr. A. P. Taylor, Dept. 57B,

FIRST
PRIZE

or

21/-
WEEKLY
PRIZE

and 6 Certificates
of Merit weekly.

Last week's prize-winner:—
F. J. Taylor, 11, First Avenue,
Blyth, in "Speed and Ac-
tion" Competition.

WALLACE HEATON'S NEW PHOTOGRAPHIC COMPETITION

Here's a chance for the amateur! He can use any camera he likes as well as his own choice of materials. This new competition offers wider scope with its range of six different subjects during the 13 weeks' run.

"Domestic Pets," commences Dec. 29th, closes Jan. 12th.
"Winter Outdoors," commences Jan. 13th, closes Jan. 25th.
"Still Life," commences Jan. 27th, closes Feb. 9th.

"Indoor Pictures," commences Feb. 10th, closes Feb. 23rd.
"Architecture," commences Feb. 24th, closes March 9th.
"Artistic Figure Studies," commences March 10th, closes March 31st.

ENTER NOW FOR THE FIRST SUBJECT!

"DOMESTIC PETS"

You don't need much guidance to get to work on this subject, you can send pictures of dogs, cats, pet monkeys, tortoises, tame rabbits, parrots or any indoor cage bird. The prizes will be awarded for the best photography.

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry). ANY MAKE OF CAMERA OR MATERIALS, DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE MOUNTED OR UNMOUNTED (not less than 8x6 unmounted is recommended).

Prizes are 21/- each week and 6 Certificates of Merit, £25 (Twenty-five pounds) for the

best photograph submitted during the competition (13 weeks

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with. Acceptance of these rules, etc., is a condition of entry.

1.—Wallace Heaton Ltd. reserve the right to reproduce once any prize-winning photograph, either £25, 21/- or Certificate.
2.—To keep any photograph and have the right to reproduce for 10/6.
3.—To purchase the copyright for 21/- from a 21/- winner or for 42/- from a non-winner. (The copyright of the £25 winner is automatically transferred to us.)

WALLACE HEATON COMPETITION

COUPON

to be affixed to each entry. Valid until Competition closes on March 31st, 1938.

Model G.16 for 16-mm. films only, with resistance and 500-watt lamp	£39 0 0

VERSATILITY

WHAT OTHER PROJECTOR HAS ALL THESE REFINEMENTS OF THE PAILLARD-BOLEX ?

The "G" Range of Bolex projectors has won an enviable reputation for reliability and fine performance made possible by their unique range of refinements. Read through the following list and see how many extra advantages the Paillard-Bolex gives.

Multifilm projection giving choice of one, two or all three film sizes according to model. Remarkably brilliant and steady pictures with a higher standard of screen illumination than any other projector on the market, not excepting those fitted with 750-watt lamps. All enclosed gear-driven mechanism. Special design of gate and stainless steel pressure pad safeguards films from wear. Exceptionally efficient cooling of lamphouse and gate, making it impossible for films to be damaged by heat in the gate. Reverse projection, separate motor and lamp switch. Still pictures.

On top of this here are two more important refinements which have been added to 1938 "G" type projectors without any increase in cost.

Choice of two or four blade shutter at the turn of a knob.—This refinement to all type "G" projectors enables films to be shown in the home at speeds below normal without noticeable flicker, using the four-blade shutter, or, by turning a knob, to change to the two-blade shutter for use on large screens in halls, etc. With four-blade shutter, projection can be as slow as 12 pictures per second, giving 25 per cent longer showing from films without obvious slowing up of motion. For large screens up to 16 ft. the two-blade shutter gives a 50 per cent increase in brilliance.

Interchangeable Condensers for 8-mm. film.—This latest refinement is fitted to the Models G.3 showing 8, 9.5 and 16 mm. films, and the G.816 for 8 and 16 mm. films, and makes available the same power of illumination for 8-mm. as for 16-mm. films.

WHAT BARGAIN CUSTOMERS SAY:

Birmingham.

"I received the camera on Saturday morning, and would like to say how very pleased I am with it. It is certainly in excellent condition and I could not have wished for anything better." F. C. B.

Ipswich.

"I have received the camera quite safely, also the case, I am very pleased with both and do not regret buying from you by post, as I could not have obtained the same type of camera at anything near your price in this district." H. H. C.

Llandudno.

"Thanks very much for your promptness in despatching the focal-plane camera. I'm pleased to mention that same is very satisfactory. Really, it is marvellous value." L. E.

WESTMINSTER
PHOTOGRAPHIC EXCHANGE LTD.
111, Oxford St., W.1
'Phone and 'Grams - - - GERRARD 1432

SPECTO Super 9.5 PROJECTOR

Unique advanced design, quite exceptional performance. Special pre-focus high intensity low-voltage lamp. Gearing and driving mechanism running in oil bath. Double-claw movement, motor rewind, speed regulator. Mechanical tilt. Separate lamp switch. Unprecedentedly high luminosity with entire absence of flicker. High-efficiency dual cooling. Complete with transformer or resistance.

£14:15:0

12 monthly payments of 25/10, 24 of 12/11.

New Model ROLLEIFLEX

In this new model the 6×6 cm. ROLLEIFLEX for 12 pictures on usual 3½×2½ spool becomes more than ever automatic, revealing a still higher standard of optical and mechanical perfection. Only one action is now needed to—

(1) set the shutter; (2) safeguard against either blank or double exposures; (3) give delayed action. There are also amongst other improvements new controls for shutter speeds and lens apertures, with magnified reading. The reflex hood is fitted with larger magnifier and there is a double magnifier and additional mirror for eye-level use. Lens is f/3.5 Tessar, with Compur Rapid shutter speeded to 1/500th sec.

Price £31:5:0

12 monthly payments of 54/8, 24 of 27/4.

New PATHESCOPE 9.5 Model "H" Projector

'for Real Home
Movies'

For the projection of 30-ft., 60-ft., 200-ft. and 300-ft. reels. Solidly built. For use on all Alternating Current mains from 200 to 250 volts. 40-60 cycles. Is motor-driven through a transformer in the base. Sprocket feed, ensuring steady, correctly central pictures with direct and brilliant screen, illumination from a 100-watt lamp; semi-automatic shutter for film protection during threading.

£10:10:0

12 monthly payments of 18/5.

NAME.....
ADDRESS.....

PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS.

"OOH, MY TUMMY!"

We wonder how many children said that on Christmas Day—we'll hazard the guess that the number would send any professor of dietetics straight into the nearest loonybin, as P. G. W. would put it.

Immoderation is a funny thing. Funny "peculiar," we mean, not funny "ha-ha." It can result in a fat head, *mal a l'estomac*, or a depleted purse, yet nobody ever seems to do anything about it. Still, why bother—you only live once!

Nevertheless, the type of immoderation that results in a thin wallet appals

us. For that reason we implore you to choose your photographic outfit with the utmost discrimination and care. Before investing in new apparatus, whether you buy it from us or not, make sure that it is exactly what you need, and that it can be depended upon to do the work you have in mind.

"202" is the only place in the country and, so far as we know, in the world, where every man is a keen miniaturist, where miniature apparatus and accessories only are stocked. Believe it or not, it means a great deal to "Try 202 for Service."

ONCE UPON A TIME

a miniaturist was sitting by the side of Lake Windermere crying fit to burst. Tears streamed down his shirt front as he bemoaned the lack of a telephoto for his Exakta. Oh, 'twas a sorry sight!

Suddenly a good fairy, wearing a strange disguise, appeared from nowhere, and listened attentively to the little man's tale of woe. She then spoke in a strange tongue, saying, "Say, getta load o' dis, buddy. Yuh ain't got whatya want, huh? Haw, dere ain't no need to toin on de waterwoiks. Dry dem lamps o' yourn, son, and getcha lens from "202" on hire poichiss. Dey's a sure-fire crowd for dat sorta stuff!"

MORAL.—Don't wish for it; buy it by hire purchase.

REVIEWS

"A perfectly book." (Vance Lining).

"Never read such in my life." (Hurcy Parris).

"Undoubtedly the work of a" (N. G. Monitor).

The above may give you an idea of what others think of the second edition of "Miniature Enlargers and Accessories," by R. G. Lewis, but why should you worry about other people's opinions when you can so easily form your own by writing to-day for a copy to be sent to you free and post free.

MINIATURE NEWS AND TIPS DEPARTMENT

TIP OF THE WEEK.—Some cameras fog film slightly as a result of light being reflected from the opening along the side. Some lens hoods are not efficient as a result of the inside having become shiny. Many cameras look old before their time, due to the enamel chipping off or leather wearing. These and other faults are easily corrected by the use of 237, which we use ourselves. It is available in two finishes: High-gloss and Dull-black. It dries metal-hard, and will not chip. If you cannot obtain it locally, we should be only too pleased to send you a tin of which ever finish you require at 2s. per tin. This looks rather more like an advertisement than a tip, we are afraid, but whatever this may look like, 237 is still wonderful stuff for renovating tired cameras.

NEWS OF THE WEEK.—By the time this advertisement appears there will just have become available a model of the Rex meter (which costs £5) suitable for use with the Leica camera. The price will be just the same as for the Universal model.

Attempts to adapt the Kalart flash-gun to the Rolleiflex have not met with signal success in this country, but we understand that the agents are obtaining specimens of the adapter in use in the States, which they believe to be quite satisfactory. We should imagine that the price of the adapter, over and above the price of £4 12s. 6d. for the gun, should be between 2s. 6d. and 5s. Until a week or two from now neither we nor the agents will be able to give you any more information than that given above, but after that time we should be able to comment on our practical experience of the American adapter.

WEDNESDAY, DECEMBER 29TH, 1937

Copyright—Registered as a Newspaper
for transmission in the U.K.

VOL. LXXXIV. No. 2564.

BY the time these words appear in print Christmas 1937 will be a thing of the past, and we hope that the holiday period has been not only an agreeable one for every reader, but that the camera has been fully employed to record incidents of the event. We are looking forward to seeing many of these prints in due course in our competitions. This issue is the last one of the current volume, and early in the New Year the Index for the volume will be ready, and binding cases will also be available from our Publishers. No better books of reference can be suggested than bound volumes of "The A.P." and we are glad to know that so many of our readers keep and bind their copies for this purpose. Next week's issue, which will be the first of the new volume, will contain many articles of interest to every reader, and particulars of a new competition that will appeal to a large section.

Photography a Gamble.

Photography is always a bit of a gamble, a fact which adds greatly to its charm. The most experienced worker never quite acquires an absolute certainty as to how the image will appear when it is developed. In other words, there is always, lurking about the dark-room, the possibility of the unexpected and the inexplicable. It is here that photography, a science but not an exact one, an art but without rigid conventions, becomes also a mystery, in both the ancient and the modern use of that word. And who would have it otherwise? If we could always be sure that the thing we saw would be exactly rendered in the picture, many of us would throw up photography straight away and take to dog-racing or something with a

TOPICS of the Week

AT THE CIRCUS.

The photographer at the Circus this year will be able to get many good shots of the audience, in addition to pictures of the performers.

spice of uncertainty about it. The same thing applies to the most casual user of the camera—the holiday snapshotter. She obtains her developed films over the counter of the blasé dealer always with a little expectant flutter that there may be something in them she had not seen at the time or reckoned on. Generally, of course, when the unexpected does turn up it is something not desired—something which has come out wrongly or not come out at all, a blank rather than a filling-in. But there is always the possibility of something round the corner. It affects the pictorialist no less. Is there a pictorialist who has not wasted an exposure on a subject against his better judgment with an unconfessed expectation that the dark, uncanny forces which surround photography may in some way work together to give him the picture of his dreams?

Low Down on the Parson.

That photography is full of the unexpected must have been acutely felt by a parson of whom Lady Rhondda tells in her newly published book, entitled "Notes on the Way." As a rule, we bar practical joking, but the results in this instance leave so much to the imagination that the story ought to be put on record. It is an adventure related by a friend of Lady Rhondda, who arrived on a hot day at a secluded little beach and lay down behind a sand dune where she could see without being seen. Two young girls came along and, getting behind another sand dune, took off their clothes and sunbathed. Along came a parson with a camera. He thought himself alone, undressed and went in to bathe, leaving his clothes and camera in a heap. Presently he swam

round the neighbouring headland. Then out from behind their sand dune stole those two girls, stepped down to the beach where his possessions lay, picked up the camera, and each took a photograph of the other. With meticulous care they replaced it in exactly the same position it had been in before, and returned to their hiding-place. One may hope that the parson did his own developing. That, indeed, seems the moral—or the immoral—of the tale.

High up on the Roof.

It was a very entertaining description which Capt. C. J. P. Cave gave to his fellow miniature workers the other evening of his researches with a miniature among the bosses of church roofs. His method is to project his miniature camera on to the roof detail, which may be 80 ft. or more above the floor, and use at the same time a powerful spot-light. In this way he has got a remarkable series of records of bosses in cathedrals and abbeys in all parts of the country, some of them showing the crude but very spirited drawing of

the mediæval sculptor. The method is so excellent that even the worm-holes and the grains in the wood are shown, and, at Peterborough, some pencil marks which a workman a century or so ago had made on the roof. The photographer in old churches may well be sometimes depressed when he remembers how much interesting old detail has been destroyed by vandals of one sort or another, including restorers, but detail in the roof, by reason of its inaccessibility, has often been preserved, although until lately it has scarcely been possible to photograph it. Certainly Captain Cave's records, rendered with astonishing clearness, do throw more light on mediæval England. With his spotlight he usually gives, we understood, from a quarter to half a minute exposure at $f/11$. The higher the roof the more the beam is diffused, so that a longer exposure is necessary.

You have to be Predatory.

Recently we enjoyed the company at Edinburgh Castle and other places up north of an amateur

photographer who was on the professional prow. He was on the staff of a technical journal devoted to an industry which was holding its convention in Scotland, and while his main interest was literary, he was concerned at every turn to get "snaps," as he called them, of the more important people, and the more unguarded the moment, the less conventional the attire, and the more unconscious the expression the better. He had with him a high-class small camera, and we sounded him for some technical information, but he was more keen on imparting psychological experience. "In going about among people and getting their photographs," he said, "you have got to be predatory. That is the secret of it. You have got to think yourself a bird of prey stalking an innocent victim. I don't mind telling you that I summon up all the rapacious, dispossessive images I can, and then—but excuse me, there's our president having an argument with the bus-conductor, too good to be lost. So long!" Well, one lives and learns.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Thermometer Systems.

Will you give me some information as to the different scales of thermometers? Is there a consistent relation between them all so that one scale can be converted to any other exactly? Why should there be different scales or readings for the same temperatures?

W. T. (Shoreham.)

To take your last question first we are tempted to ask, "Why shouldn't there be?" There are similar differences in weights, measures, currency systems, and even rules in the same or similar games.

Sir Isaac Newton published in 1701 details of an instrument he had invented for recording temperatures between the freezing and the boiling points of water, using the duodecimal system. In 1714 Fahrenheit introduced his modification of Newton's instrument. He divided each degree into two parts, and started from what he considered "absolute zero" which was 32 degrees below the freezing point of water.

Celsius (France) divided the space between freezing and boiling points into 100 parts, hence the name Centigrade. Reaumur (Germany) divided the same space into 80 parts. If we subtract Fahrenheit's 32 degrees from all his numbers this will make his boiling point of water (212 degrees) into 180 degrees. We then get the following gradations between the freezing and the boiling points of water:

R.=80; C.=100; F.=180.

If we divide these ratios by 20 we get:—

R.=4; C.=5; F.=9.

These ratios then show, for example, that Reaumur is $\frac{4}{5}$ ths of Centigrade; Centigrade is $\frac{5}{4}$ ths of Reaumur; and so on. Thus if we want to convert Centigrade into Reaumur we

multiply by 4 and divide by 5; to convert Reaumur into Centigrade we multiply by 5 and divide by 4.

When it comes to converting from Fahr. to another scale we first subtract 32, before applying the appropriate ratio; when we convert into Fahr. we apply the ratio and then add 32. Thus, from Fahr. to Cent. we subtract 32 and take $\frac{5}{9}$ ths of this remainder; that is, multiply by 5 and divide by 9. From Cent. to Fahr. we use the ratio $\frac{9}{5}$ ths (multiply by 9 and divide by 5) and then add 32.

Desensitising Plates.

I am used to developing plates by inspection, using a red safe-light. I now wish to use pan. plates instead of ortho. How should I desensitise them?

A. S. (Balham.)

There are variations in procedure, but the following method is usual and satisfactory. Dissolve 1 gm. of pinacryptol green in 17 oz. of warm water; filter, and keep in a coloured bottle in the dark. The working solution is 1 oz. of this stock to 20 oz. of water.

If the plates are backed it is advisable to remove the backing with water and a sponge or cotton-wool, rinse both sides under the tap, and slip the plate face up into the developing solution. A piece of cotton-wool should be passed lightly over the surface to remove possible air-bells. Careful workers can use a fingertip. Rock the dish gently for two minutes. The procedure so far is carried out in complete darkness—an easy matter with a little practice.

The safe-light can now be switched on, the plate rinsed under the tap, and development proceeded with as in the case of ortho. or ordinary plates. In fact any treatment is allowable that would be safe for bromide paper.

1937—and All That

During the year that is now closing, photography has made quiet but notable advances in almost every direction. Its popularity has increased, cameras and enlargers have been improved in many important details, and the latest sensitive material shows unprecedented fineness of grain for its speed. Advances come singly during the year and so may escape notice, but the article below shows that 1937 has contributed much to the development of photography.

WITH the closing of a year it does not come amiss to take a brief glance backwards and review the strides that have been made towards the betterment of our great hobby of photography. It can quite truly be said that never in the history of the hobby have such great strides been made, and that the fortunate amateur is now looked after, so to speak, from "the cradle to the grave."

The miniature has consolidated the place of favour which it had gained during the previous year or two, and a glance at the advertising matter in any photographic journal will reveal that it has pride of place on the dealers' counters.

Foolproof Cameras.

Perhaps the greatest advance has been made in the direction of the production of instruments that are as nearly foolproof as it is possible to make them. No longer has the raw amateur to wonder if he has taken two exposures on one piece of film, or if he has turned his film without exposing. Interlocking devices between the shutter and the film wind have come rapidly to the fore, and are a feature on most of the latest cameras.

Camera-shake, the problem which occupied our minds very strongly when the miniature first came into our vision, has been largely obviated, both on miniatures and on the more ordinary types of camera, by the introduction of a shutter-release operated from the body, and there is little doubt that most cameras will follow this practice, which is an excellent one, especially on cameras with bellows extension.

Fine Grain.

The grain on the negative has become a matter of such prime importance that our methods of developing are becoming changed. No longer will an ordinary developer do for the amateur photographer, his solution must be made up of constituents chosen especially for their ability to reduce grain. In the wake of this movement has sprung up D. & P. firms who specialise in fine-grain work, and who will produce negatives of enormous enlarging possibilities. Yet another instance of the careful

nursing which the modern amateur receives, and which the old hand of forty years ago might have sneered at very heartily.

Speed-Guns.

Smoky flashpowder has also lost its prestige, and photo-flash bulbs have usurped its former position, while an even newer venture has been the introduction of the synchronised flash-gun, more popularly known as a speed-gun.

With these, indoor speed work has become an accomplished fact, and not the dream which it was only a couple of years ago.

Chromium Plate.

The bright parts of cameras and other apparatus must now, in this luxurious age, be chromium-plated. This greatly adds to their distinguished appearance, but many amateurs have expressed their disapproval on the grounds of the attention which is attracted when one is trying to use the instrument unostentatiously. There is something to be said for this point of view, especially with regard to the smaller cameras, which have the great advantage of being used without attracting attention.

Enlargers.

The horizontal enlarger has completely taken a back seat now, and the advertisers' announcements only reveal an occasional model as against literally dozens of the vertical type. These instruments have tended to become more automatic, and many of the very latest are real luxury models. The novice should not, however, be dismayed by the fact that he has been unable to purchase one of these de luxe models. Every enlarger has to be based on certain principles, and if his humble instrument complies with these then he will be able to turn out just as good enlargements with it as do the mighty with their high-class apparatus.

Exposure Meters.

The photo-electric exposure meter now heads the field in the race for exposure meter supremacy, and improvements have been made even on those instruments which were not so very long ago described as "the last word in exposure meters." More

sensitive cells have been introduced, the angle of view has been restricted so as to be the same as the camera lens, and in one case there is an amplifier for work in dim light.

The Exhibitions.

The big exhibitions have been held as usual, and there was little marked change to be noted here, although it is fairly obvious that chloro-bromide has lost a good deal of its favour, and bromide has been relied upon in a great many cases. The exhibitions also reveal less of the stunt photography than has been seen in recent years, and the presence of highly-glazed prints is another feature which may be commented upon. An excellent piece of practice for the amateur is to produce an enlargement of good size on glossy paper and to glaze it, then to note how this method displays its faults, besides making retouching more difficult.

Literature.

Never has the amateur photographer been catered for so well on the literary side; 1937 has seen the production of numerous books on all phases of the art, many of them at quite reasonable prices, and some of the more expensive ones very outstanding as filling a need in the worker's life.

Among this mass of literature must be mentioned the free brochures and booklets distributed by many of the larger firms, a mine of information beautifully produced, and containing invaluable instruction on their own particular subjects.

General Résumé.

One note stands out in looking back over the year's progress, and that is that generally photography has tended to become more expensive. Cameras of precision cost more than the older patterns, the processing of negatives is also more expensive, while the accessories are also dear. Against this may be offset that a larger proportion of successful pictures should be produced with less effort, and thus probably the matter balances itself.

Photography in its principles and practice remains the same, and will be enjoyed by many more amateurs in the year to come because of the very appreciable advances which have been made in 1937.

A YARD OF

By F. READ.

It is all as easy as pie—if you have electric light!

The writer has not this blessing of civilisation, as he lives in the wilds of the country. Possibly there are others similarly situated, and in case envy should eat the heart out at the thought that photography so easy to the smoke-loving townsman is denied them, let them cheer up. It is just as easy for them to take indoor pictures.

Flash-bulbs, you will say, are the very obvious solution. This is not the case. Flash-bulbs are a great acquisition but they are expensive. Where it is desired to keep the camera going more or less all the winter, magnesium ribbon offers the cheapest solution. Perhaps it is not possible to take every subject you may wish with ribbon. Baby in his bath, or with a pose that cannot be held, requires a flash-bulb, and for such you must either go without your picture—or your lunch.

On the other hand, there are plenty of figure studies you can arrange, and in which an exposure of a fifth of a second or a half at $f/5.6$ or $f/8$ can easily be given. For this is all that need be given with an ultra-fast panchromatic film and

PRACTICAL PHOTOGRAPHY.
 $1/5$ th sec., $f/8$, S.S. Pan. film.

PHOTOGRAPHY indoors at night is at the moment immensely popular. The introduction of the extremely fast pan. films (which are remarkably sensitive to artificial light), plus a couple of Photoflood bulbs (wonderfully cheap), makes every keen worker want to try his hand at interior work, especially as outdoor work, even if one is willing to face its discomforts, is limited to a few hours each day.

HOME LAUNDERING. $1/5$ th sec., $f/5.6$, S.S. Pan. film.

NEARLY BREAKFAST TIME. $1/5$ th sec., $f/8$, I.S.S. film.

a few inches of ribbon as your light. A $\frac{1}{4}$ -oz. roll of ribbon costs under a shilling, and holds enough for a hundred or more exposures.

The method of use is simple. You can if you wish pull off about 8 in. of ribbon, straighten it by drawing it through your fingers, hold one end in a pair of pliers and light the other. The writer's plan is to burn two lengths of 4 in. each together, as this gives a two-power magnesium light with one-half the burning period of the longer length.

It is only a moment's task to place two equal pieces, each about 4 in. long, together, and since the ends may not hang close enough for simultaneous lighting, put a strand of

RIBBON

cotton around them about 2 to 3 in. from the ends. There is no need to think it is going to be a difficult task both to light the ribbon and fire the shutter with one hand (since the other is holding the pliers). In fact, you do not want to release the shutter until the ribbon is well alight and the whole length aflame, as then you get the full benefit of your light. To ensure quick and even burning it is an advantage to give the ribbon a slight rub through a piece of emery paper. This removes any surface oxidation.

THE YOUNG SEMPSTRESS. $\frac{1}{2}$ sec., $f/5.6$, I.S.S. film.

these photographs is the sitter facing the camera. Facing the camera means facing the light too, and it is not easy to find a sitter who can gaze calmly into the flare of burning magnesium. Screwed-up eyes, therefore, are likely to result, so that the full-face portrait is best avoided.

TIDYING UP. $\frac{1}{2}$ sec., $f/5.6$, Hypersensitive Pan. film.

(The roll of ribbon when not in use should be kept airtight. A piece of oiled paper, such as bromide paper is wrapped in, serves.)

You can if you like point the ends of the ribbon to a very sharp V, as they light the quicker. The pictures show what the writer has achieved with his exposures. Perhaps they are not so good as might have been secured with another illuminant, and ribbon does admittedly make a certain amount of smoke, but at the same time it is often the only way of securing a few pictures. Their shortcomings must to some extent be placed to the deficiencies of the method, even to the brush which shows under the Quaker Oats box.

It may be noticed by the observant that in none of

MAKING HER CHOICE. $\frac{1}{5th}$ sec., $f/8$, I.S.S. film.

Readers' Hints, Tips and Gadgets

SIMPLE FILM-DEVELOPING EQUIPMENT.

THOSE who find one of the excellent modern developing tanks beyond them, and who are tired of "see-sawing" valuable negatives, may be interested in a method I have adopted which gives me perfect results.

My aids are, (1) the apron of a Kodak $3\frac{1}{4} \times 2\frac{1}{4}$ daylight developing box, (2) a 2-lb. size earthenware jam pot, (3) a roll of 1-in. adhesive plaster.

From the apron, which I bought at a photographic store for 9d., I removed the two wire ends, leaving the eyelet-holes intact, this being the only alteration necessary.

And now to the method.

The apron is vertically attached to the dark-room door by the two eyelets, which pass over two small screws set apart to the appropriate distance, as shown in Fig. 1. The pimplly side should be facing the operator.

About 2 in. of adhesive plaster is now attached to the top of the apron, the lower edge of the plaster remaining free to receive the film as in Fig. 2.

A second piece of plaster is placed conveniently to hand and the light switched off. The film is removed from the backing paper and one end is slipped beneath the plaster and stuck down.

Handling by the edge, the film is unrolled and the lower edge is fastened by the second piece of plaster to the apron. The emulsion should now be facing the operator.

The apron is removed from its support and rolled up with the film outside.

When rolling up towards the end of the film, the apron forms a loop, as in Fig. 3, but this is easily overcome by lifting the tape and fastening the film down as high up as is necessary to get the apron flat. The rolling up is then completed with the film protected by the excess length of the apron. In those films having a special anti-halation backing it is advisable to ease the film a little higher up the apron, as in Fig. 4, to enable the film back to bleach satisfactorily. The use of the earthenware pot enables developing, fixing and washing to take place in the same vessel, and any film from $3\frac{1}{4} \times 2\frac{1}{4}$ to shorter lengths of 35-mm. may be processed in the same apron.

No difficulty should be encountered in obtaining an apron, as dozens of Kodak film tanks are to be obtained second-hand, complete for a few shillings each, in photographic stores. As an alternative, Messrs. Kodak sell their film apron separately quite cheaply.

The results obtained by this method should be indistinguishable from that of any system using aprons as part of the process, and negatives should always be completely free from scratches or marks.

B. EDELSTEIN.

AN END TO MATT MARKINGS ON FILMS.

FOR nearly two years I, like many others, have been troubled with the matt markings caused by the backing paper sticking to the film during development in a

Kodak tank. I have tried several suggestions in the hope of finding a remedy, from adjusting the tension of the spring clip holding the spool of film to reversing the spindles. But after each attempt I have still had to resort to Baskett's reducer to remove the marks.

It appeared to me that the only solution lay in separating the backing paper from the film before development, and after a number of attempts I succeeded in doing this in the Kodak changing-box.

The operations are simple, and since adopting this method I have experienced no further trouble of any kind.

Instead of fastening the end of the film to the backing paper as directed, a length of paper about $10 \times 2\frac{1}{4}$ in., which we will call the "trailer," is attached to the gummed paper on the film. Ordinary writing paper can be used for this. The whole is rewound and placed in the changing-box. Unwind sufficient length to attach the trailer to the reel, but before doing so, make a small coil of the backing-paper which must unroll from below the trailer, as shown in the illustration, so that it falls to the bottom of the box. The apron is now hooked on to the reel, the lid replaced, and the film wound in the usual way. When the end of the trailer is reached, the film, unaccompanied by backing paper, follows it into the apron, and is wound up securely out of contact with anything save the apron itself. There is sufficient room in the bottom of the box to allow the backing paper to coil itself until the end of the film is reached, when it will be uncoiled and wound double from the point where it is attached to the film.

Development can now be carried out without risk of any further trouble caused by the backing paper sticking, as this will now be wrapped safely round the outside of the apron.

E. R. MOORES.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

A Miniaturist's Day By HAROLD BURDEKIN.

MR. JONES, who is an ardent miniature camera worker, lives next door to me. Often in the evening we visit each other and have a chat on various difficulties which we both meet in working the miniature camera.

Finding Subjects.

One night recently whilst we smoked our pipes over the fireside, Jones said to me, "I do find it hard to find good subjects for my camera during the winter months." This remark struck me as somewhat strange, coming from a man who was such a keen miniature worker. To cut a long story short I promised Jones that the very next day, wet or fine, I would take my Contax up to the office and secure a series of pictures to show him that under every condition it was possible to photograph, providing one possesses a seeing eye.

After Jones had left and before retiring for the night I loaded my Contax with a fast panchromatic film, as I knew that during the winter months the light is often very bad. I was fortunate in owning an $f/1.5$ lens, so I put this in the camera in place of my standard $f/2.8$ lens. The $f/1.5$ lens has a focal length of 5 cm., which enables me to get good perspective as long as I do not approach very close to my subject. I had an ever-ready case for my camera, so that it was an easy matter to carry it over my

shoulder when I set out for the office.

Next morning whilst we were having breakfast I saw Susan, my little girl, drinking her milk. It occurred to me that here would be a good study to start my series; so placing her about 7 ft. from the window, I snapped her at $1/10$ th second at $f/2$, the early morning winter light being very dull.

I live in the country and have a walk of about a mile to get to the station. There is a short cut across some fields to the station and on my way I saw three horses looking over a gate. My electric exposure meter gave a reading

BREAKFAST-TIME. Contax, $1/10$ th sec. at $f/2$. Fast Pan. film.

BATTERSEA POWER STATION. Taken from moving train. $1/300$ th at $f/1.5$.

London I thought it would be an interesting experiment to try my hand at taking a picture from a moving train. I had not tried this before. As we approached Battersea Power Station I set my camera to $1/300$ th sec. at $f/1.5$ and took my picture from the moving train.

A Lunch-Time Portrait.

After a morning's work in the office I went out to lunch with my friend William Smith, and when our meal was over I suggested that I should take his photograph sitting at the table in the restaurant. Smith, who knows nothing of photography, at once said I could not possibly let off a flash in the restaurant. "Of course not," I replied, "I am just going to snap you with the ordinary artificial light here." So I rested my camera on the back of a tall chair and gave an exposure of $1/5$ th second at $f/2$, and got quite a good likeness of him.

LUNCH-TIME RECREATION. $1/5$ th sec. at $f/2$, artificial light.

of $1/25$ th second at $f/3.5$, so I added the three animals to my bag.

At the Station.

A little snow had fallen during the night and whilst I was waiting for my train to take me up to London, I took a picture of an engine which was shunting. I had a light yellow filter in my pocket so I fixed it on the lens to give me a better rendering of the snow. I did not want to use too deep a filter, as there was some mist in the background which I wanted to retain. Snow reflects quite an amount of light, so in this case my exposure was reduced to $1/50$ th second at $f/3.5$.

As we were approaching

BUSY HANDS. $1/10$ th sec. at $f/2$, daylight.

POINT DUTY. $1/5$ th sec. at $f/1.5$. Fast Pan. film.

On the way back to the office I passed a shoe-black earnestly studying the sporting columns. I am always careful to catch people when they are not conscious of the camera as the results are so much more telling. Here I gave an exposure of $1/25$ th at $f/8$, as the lighting conditions in the middle of the winter's day were better.

Arriving back at my office I found Miss Clark my typist busy typing some letters. Before I settled down again to

business I took a photograph of her hands and the typewriter. It was pretty dull in the office, so I gave $1/10$ th second at $f/2$, steadying my camera on a nearby file cabinet so as not to shake the camera.

After I had finished my day's work I walked through Leicester Square and Piccadilly, from whence I took a bus to Victoria Station. I felt that I should show Jones that the miniature camera can very successfully take snapshots in the streets after dark. The illuminated signs in Leicester Square were quite easy to take, and I fired off several quite successful exposures at $1/25$ th second at $f/4$. These, of course, showed only the signs themselves against a dark ground.

Piccadilly by Night.

When I arrived at Piccadilly I saw a policeman holding up the traffic. I steadied my camera against a lamp-post and let off my shutter at $1/5$ th second at $f/1.5$. I was glad I gave this rather long exposure as I managed to

retain some of the detail in the shadows.

After supper I developed my roll of films in a tank, using a fine-grain developer, and next evening I was able to show Jones the prints. I think the series of pictures I took on one day, and of which a selection has been chosen to illustrate these notes, has quite convinced him that pictures can be obtained in the most unexpected places with a miniature camera.

DEEP IN THE NEWS. $1/25$ th sec. at $f/8$, early afternoon.

Stage Photography with a Miniature Reflex By WILFRID BARBER.

THE miniature reflex with an $f/3.5$ lens is quite capable of producing good results, and even an $f/4.5$ lens will cover some stage "shots," providing you select the right moment for exposure. It is essential that the camera be fitted with an eye-level viewfinder, a good lens hood to prevent any stray light entering the lens and, if desired, a wire-release of about 8 in. in length. Fast panchromatic film must, of course, be used.

Permission to Photograph.

It is necessary to ask permission of the manager of your local theatre or picture-house (most picture-houses now include a stage show in their programme) to take photographs of the acts, and I have found it better to apply personally than to write. You can usually get permission if you explain that you are doing it as a hobby and are not intending to hawk your pictures at the stage door for financial gain. It is very unwise to use these photographs for competitions, public exhibition or to have them published in any way without first obtaining permission from the management. Most managers show some interest and would appreciate copies of your work.

Choice of Seat.

After obtaining the necessary permission it is a good plan to visit the theatre or picture-house with a view to selecting the best seat from which to photograph. In the case of the theatre, and if funds allow, the box a little above stage level is the best, especially if your reflex does not provide for a telephoto lens. The cinema with its stage show calls for different tactics, and the best position here (boxes are not usually available) is in one of the seats in the front row downstairs, next to the orchestra pit. Choose a seat a little to one side of the

conductor (if the cinema boasts an orchestra) so as to avoid the conductor's swinging arms and the first violin. As you will not always get the seat you require it is just as well to have a second seat in mind.

Preparations.

When the show begins and you have attached your lens hood and wire release, forget the show and focus on a spot about 3 ft. from the footlights and make a note of the distance registered on your camera, then focus on middle stage and again, making a note of the distance, repeat the performance for back-stage distance. The actors themselves will occupy these various distances during the performance, and if you have no time to focus on a fast-moving act these three given marks will enable you to judge the distance of the actors, especially as your $f/3.5$ lens will give you sufficient depth of focus to cover a slight error in your estimate.

Another great help in this respect is to remember that acrobats, etc., usually occupy middle stage, while comedians operate about 3 ft. from the footlights. Focus accurately when you have the opportunity, however.

Easy Subjects.

Avoid dancers and fast-moving acts to begin with, and concentrate on the slower stuff. If back-stage is draped with light curtains you are in luck's way as black drapes are detrimental to good results, especially if the "spot" is the primary light. Dress suits and dark clothing have a habit of merging into the blackness, and freak results are liable to appear.

Set your shutter at $1/50$ th sec., or at $1/25$ th if your widest aperture is $f/4.5$. Once you "feel" that the actors will keep in focus for a few seconds keep them in view at eye-level, watch for

the "still" moment, and release the shutter. If you can obtain a pre-view of the show you will soon spot the exact moments favourable for exposure. Don't waste film on coloured lighting effects, wait always for white light.

Exposures of $1/10$ th sec. and even longer have been successfully used for this work, but it is necessary to find some support for the camera in these cases, and this means the use of a tripod or some supporting rail in the circle. As most reflexes of the miniature type do not provide for interchangeable lenses the circle must be ruled out, as a telephoto lens would be necessary.

Development.

Owing to the fact that with an $f/3.5$ or $f/4.5$ lens your exposures will not have been sufficient for the shadows, it is not wise to develop your films in a super fine-grain developer. These developers, if they demand an increase in exposure, must be avoided. One of the best developers for our purpose is Johnson's fine-grain developer. I usually develop at 65 to 70 degrees for the full time given, and if the high-lights are a little clogged I resort to shading during enlarging.

Give the film a good wash in several changes of water between development and fixing. Acid hypo is preferable, but not advisable if using a metal tank. After the film has been washed it is a good plan to run it through a 2 per cent solution of acetic acid in order to remove any "scum" left on the film by the tap water, give it a final rinse and then hang up to dry in an atmosphere free from dust. A perfectly clean and dust-free negative is essential, as the tiniest flaw of any kind shows up terribly in enlarging from the very thin negatives that stage photography yields.

Modern Miniature Enlargers

THE FILMARUS MODEL O.

THIS enlarger is the smallest and simplest of the very wide range of M. & W. enlargers, which are offered in both automatic and manually-focussed versions for negatives in all sizes. The Filmarus Model O is a non-automatic instrument for 24×36 mm. and 3×4 cm. negatives, and is most conveniently small and compact.

The baseboard measures 12×10½ in., and has firmly bolted to it an upright of height 21 in. The arm carrying the projector-head slides on this, and is provided with a strong spring-loaded clamp for holding the arm at the desired height.

The projector-head itself is quite small, but nevertheless accommodates a 100-watt opal lamp with E.S. cap. Even illumination of the negative is assured by the inclusion of a single-lens condenser, which is readily removable for cleaning. The use of an opal lamp makes it unnecessary to include any provision for centring the light-source.

The lens is an f/6.3 M. & W. enlarging anastigmat of focal length 4.5 cm. and fixed aperture. It is detachably mounted on a metal panel which is connected to the body of the enlarger by bellows. Focussing is easy and convenient, and is carried out in two stages. First the lens-panel, which is supported by a tube running over a metal rod, is moved up or down to give approximate focus, a

spring clamp, released on pressure on a button, automatically retaining the panel at the height to which it is set. Fine focussing is then carried out by moving the lens itself, which is carried in a focussing mount having a short range of movement.

The negative carrier is of book-form pattern, the film being held between two glass plates, the ends of which are bevelled to render scratching of the negative impossible. It is intended that film should be used in the

strip, and troughs are provided on either side of the carrier to take the rolled-up ends of the film. A spring-release is fitted to the carrier to allow the glass plates to be separated for moving the film along to bring a fresh negative into view, and the design is such that a fresh strip can readily be slid into the carrier from the front without having to remove the carrier from its slot. A mask, sliding into position below the carrier, is provided for either the 3×4 cm. or the 24×36 mm. size as required, and an orange filter to swing over the lens when adjusting the printing-paper into position on the baseboard is included as part of the standard equipment.

With the focussing fully extended, the Filmarus O gives a minimum magnification of about 1½ diameters, making a print approximately 1½×1½ in. in size from a 24×36 mm. negative. With the projector-head right at the top of the column, the magnification rises to nearly 9½ times, allowing prints about 13½×9 in. to be made from the whole of a 24×36 mm. negative.

There is no counterpart to the Filmarus O in the range of models with automatic focussing; the smallest of these is the Fam Model I, which corresponds to the non-automatic Filmarus I for negatives up to 4×4 cm. These are rather larger instruments, giving magnifications up to 10 diameters and having a baseboard of size 17×12½ in., but are in general design closely similar to the Model O described.

Complete with one mask, the Filmarus O costs £7 9s. 6d., while the Model I is priced at £9 13s. 6d. when fitted with f/4.5 lens, but can be had at prices from £6 6s. with a fitting to take a lens from a Leica, Contax, Kine-Exakta or Robot camera. The automatic model, to which an f/4.5 lens is fitted, costs £14 14s. Further details of this extensive range of enlargers can be had from the sole importer, Mr. R. E. Schneider, 46, Farringdon Street, E.C.4, and the instruments can be inspected at almost any photographic shop.

Miniature Camera Gossip

By LANCELOT VINING.

THE New Year is very close at hand and I expect most of us are busy with the usual list of good resolutions to be carried out; well, here's hoping that the photographic ones last longer than the others. I wonder what 1938 will produce for the photographic world? New gadgets by the score I expect, a few really useful, but, as in the past, many will probably prove to be just plain bank-balance reducers.

I shall be quite satisfied if we get the new Agfa Super-Speed film, a large wire flashlamp on the lines of the American No. 70, and if my developer No. 16 turns over a new leaf—it's been a perfect little devil since the cold weather set in.

Cheated.

Yes; and by a cheetah. I have

A BURSTING BALLOON. 1/1,250th sec., Agfa I.S.S.

loons with darts dropped from 4 feet, but I find that the speed with which the rubber contracts beats my fastest speed. You can see in the illustration that although the dart is sharp the bursting balloon is blurred.

Circus Tips.

Get your seat as near the ring as possible. Have a good lens-hood with you and don't forget to use it.

Seats at the end of rows nearest to the two ring entrances give very good positions, as the stairs up each side of the entrances give clear views of the ring.

Fast pan. films are the safest to load your camera with, but I have an idea that a great deal of good work will this year be done with the Agfa F.

If you have a long-focus lens take it with you, for there are many turns when it will be useful.

When it comes to developing, remember that circus subjects are contrasty. I do not advise the trying of new developers, but I.S.S. with Metol - Meritol and Agfa F with D76 diluted will be my choice.

Try to manage a second visit at least; many failures occur on the first visit through not knowing what is going to happen.

IN MID-AIR.

Two Photoflux lamps in Mendelsohn gun. 1/1,250th sec. at f/2, Agfa F film.

proved one thing; a cheetah at full speed, photographed broadside-on at 15 ft., requires less than 1/1,250th to obtain a sharp result. This speed was about right for a jumping picture at 25 ft., but next time I shall have to swing with the animal.

The balloon cheated me too. I have been photographing the bursting of bal-

CHILDREN and ANIMALS

By
B. H. SWART.

IF there is one thing at which the little miniature excels, it is in "natural" studies of children and animals. It is speedy, unobtrusive and easy

looked up and saw the canine beggar. He went on eating; but then his heart smote him. He bent nearer and said confidentially: "Do you really want a piece, doggie?" And am I wrong in thinking that the doggie answered fervently: "You bet!" (No. 2.)

At any rate the little boy thought so too, for he extended the biltong towards the dog with the words: "Why, then, take it all!" (No. 3.) And as he walked away I heard him muttering: "I can always ask mammy for some more."

And there you have as interesting a story as possible, in three pictures. - No expensive equipment was necessary, and no especial knowledge.

The main value of a story - sequence is that it can interest even those who do not know the actors. Everyone likes a story; but no one who doesn't know him will take much interest in snapshots of little Johnny Smith. The difference is, in a small way, like that between a record photograph of a view, of interest only to those who know it, and a pictorial rendering that anyone can enjoy.

to handle, all of which attributes are essential in a camera if one wishes to catch the youngsters unawares. And although mine is only a very inexpensive miniature (£5 5s.) the three pictures reproduced herewith show that my results are not unsatisfactory.

All three were taken within five minutes one morning this winter. I was sitting on my stoep reading, but had the camera ready, next to me, for my little boy was playing just below the stoep, at the same time chewing a piece of biltong. Although it was winter, my exposure meter showed me that the South African sun still needed 1/rooth sec. at f/8.

Soon my opportunity came, for a stray dog came into the garden. He sidled up to the little boy and sat looking at him in dejected attitude. As clearly as words could have expressed it, he was saying: "Gee, little boy! Ain't you goin' t' give me some of that biltong?" (No. 1.)

For some time no notice was taken of him, for the man with the biltong was too busy chewing. At last he

No. 2. "Do you really want a piece, doggie?"

No. 3. "Why, then, take it all!"

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

CHOICE OF FILTER.

Would you kindly recommend me a filter for my Leica camera, as I am not satisfied with the rendering of clouds that I have been getting without one?
H. B. D. (London.)

In obtaining filters for your Leica camera we would strongly recommend that you make your choice from the range offered by the makers of the camera, as these are probably the only ones which can be used at the same time as a lens hood. The Leitz No. 1 filter is a good all-round choice, suitable for both orthochromatic and panchromatic films, and experience with this will soon tell you whether you would find it advantageous to add a paler or darker yellow filter, or a green, orange or red one to your equipment. The factor for the No. 1 filter is about 2½ with the average panchromatic film, or from 2½ to 7 times with ortho. film, according to their character.

ULTRA-VIOLET FILTERS.

Several firms market "almost colourless" filters for miniature and other cameras, and recommend them for use among mountains. Can you tell me how these compare with ordinary yellow and green filters in the matter of colour-rendering? Are they of any use in fell country where the predominant colours are green and brown?
W. A. B. B.-B. (Market Drayton.)

These almost colourless filters for use in high altitudes are not intended for the purpose of giving colour correction. Photographic lenses are seldom quite perfectly corrected for ultra-violet light, and where, as in high altitudes, the amount of this is excessive, an unsharp image formed by ultra-violet light overlays and consequently blurs the main image, giving an effect of unsharpness to the negative as a whole. The ultra-violet filters are designed simply to remove this effect, and the colour rendering obtained is practically the same as that obtained at sea-level when using no filter at all. At low altitudes, where there is but little ultra-violet light to filter out, these filters have no appreciable effect of any kind.

LENS FOR ENLARGER.

I am thinking of making an enlarger, and would like to know whether the f/2.9 lens from my miniature would be suitable. I am doubtful whether the aperture will be big enough. G. J. D. (Cardiff.)

The lens on your miniature camera should be very suitable for use in an enlarger, and we regard the aperture as being more than large enough. Very few enlargers, in fact, have so fast a lens; f/3.5 is the fastest normally used, and f/4.5 is commoner. In practice you will in any case probably prefer to stop the lens down to about f/6.3.

FIXED-FOCUS SUB-MINIATURES.

Can satisfactory definition be obtained with a fixed-focus 1-in. lens at f/3.5 on a camera using 16-mm. film as negative material? I. M. (Bewickshire.)

The hyperfocal distance for a 1-in. lens at f/3.5 used on a picture of size 13×18 mm. is about 35 ft., on the assumption that the standard of definition in the print is to be that taken in the depth-of-focus tables issued by Messrs. Leitz in conjunction with their Leica camera. If the lens is permanently focussed on this distance satisfactory definition to this standard will be had in photographing objects from 17½ ft. to infinity; for nearer objects either there must be a focussing arrangement or a lower standard of definition must be accepted.

CONDENSER OR NOT?

I am buying an enlarger and do not know whether to choose one with or without a condenser. Do the extra lenses in the condenser enlarger make the picture sharper? And will prints from a condenserless enlarger require more retouching?
E. C. (Suffolk.)

The condenser is not concerned in any way with forming the projected image of the negative; all it does is to give even illumination with the minimum loss of light. You will therefore not find any difference in definition between enlargements made with a condenser and without one. If you do not use a condenser the prints will certainly not require more retouching, and they may quite possibly require less, as scratches, specks of dust and so on cast less well-defined shadows in diffused light than when illuminated by the directed light that has passed through a condenser.

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CDXVIII.

Mr. F. H.
FLETCHER.

From information communicated to our Special Representative.

"THE invitation to contribute some notes on 'How I make my Exhibition Pictures' was received by me with somewhat mixed feelings, for a picture to be of that quality necessary for distinction in a good exhibition is not 'made,' it just 'happens,' and it does not 'happen' very often. Too often the mechanic is lauded, much too frequently the artist is betrayed by faulty technique. But when the artist is fortunate in dropping on his subject in ideal surroundings and lighting, and can sustain his good fortune with adequate mechanical excellence, a good picture is born, and the result is just as much to be admired as it is easy and just to deplore the mediocre quality of much of the work of painters.

"An exhibition picture ought to be almost wholly made before the shutter is released. The principal essentials, to

my mind, are a lens of sufficient focal length to secure perspective, and, in these modern days, an exposure meter of the highest efficiency possible. I like to work with a lens of a focal length, if possible, of between two and three times the diagonal of the base material I am using. To my mind the ideal is a 17-in. lens on a 5×4 negative; if the subject will not allow of this, then as long a focal length as is possible without compelling a backward standpoint more than is appropriate to the circumstances. But I must not be taken to condone the modern view that the foregoing remarks apply to negative bases little more than a square inch.

"I use a Weston Exposure Meter and 5×4 Soho Reflex, or a Zeiss Miroflex, with, generally speaking, Agfa negative material.

"Using an exposure meter I consider it quite safe to tank develop, to the instructions given by the makers. The slight differences of exposure which outcrop can be compensated by an appropriate selection of printing paper. All printing papers are good, and there is not much to be gained by chopping and changing. I use the paper I am familiar with—the Kodak range, with the developer recommended by the makers. All except promising negatives are rejected without the trouble of drying. Of the selected negatives each is tested by trial and error and the results carefully noted. Once proved, the data secured rule all subsequent enlargements.

"I do not resort to 'doctoring.' To my mind this does not belong to photography. I do, however, control the enlargement, and frequently have a dozen different rates of exposure on various parts of the picture. Working, as I do, with large figures, the original background is not of much importance. To get the effect I want I generally make a sketch by means of the enlarger, and a cut-out which enables me to black out any background of an undesirable nature.

"I do not despise the miniature camera. I use it quite a lot. It is a great improver of 'after-technique,' and this is its greatest charm. I also envy the 'old-timers,' who had many advantages with their slow plates and, comparatively speaking, long-focus lenses. When they did get a picture it was a good one.

"Finally, I recommend a good photographic paper. Mine is *The Amateur Photographer*. A paper of this class is not only an aid to good technique, but much to be recommended for its tips in the region of artistry. I am on less sure ground with regard to photographic societies, although I am very fortunate with one of my own, the Farnham P.S. I am also a member of the 'Royal,' but I really despair of a society which has a 'Miniature Section.' A picture must be judged by its intrinsic appeal as a picture. To give it room under a special regulation, because it is from a miniature camera, is serving the art of photography scurvy trick."

(A further example of Mr. Fletcher's work is reproduced on one of the centre Art pages.)

F. H. Fletcher.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THE DAY'S WORK DONE," by G. L. Hawkins.

THIS fine and noble landscape owes its appeal to its extraordinarily luminous quality and to its extremely attractive rendering of a sky that is graced with dappled clouds of uncommon formation. It is dignified and highly impressive, and it is notable in that it achieves its effect and attains its end without the slightest departure from the accepted rules for landscape composition.

There is no straining after effect by the choice of an abnormal viewpoint; the group of figure and horses is strongly placed and occupies a position that is precisely according to rule; and the picture proportions, having regard to the predominating influence of the sky, are almost exactly what would be adopted by any experienced landscapist. It may be that the camera was directed slightly upwards, but there is no visible distortion arising as a consequence, and, unless the camera was fitted with a rising front with an extended range of movement, it would be difficult, if not impossible, to arrange for the inclusion of so high a proportion of sky.

And if the sky were curtailed a good deal of the appeal would go with it. The subject would lose not a little of its dignity and the feeling of light and space would also be diminished. The first impression—dignity—arises partly on account of the fact that the subject is shown as an upright, as distinct from the more usual horizontal formation applied to landscape, and partly because of the relative proportions allotted to landscape and sky, the former representing a ratio of something like 1 to 5 of the latter.

The great depth of tone in the group, placed as it is against one of the brightest parts of the sky, is mainly responsible for the remarkably luminous suggestion the picture conveys. The contrast of tone is exceedingly forceful, and the light is

most powerfully thrown up by its conjunction. Added to which, the gradual diminution in values as the sky ascends to the zenith and the enclosure suggested by the uniformly dark tone of the landscape beneath do much to enhance the impression. There is no doubt but that the feeling gets across in unmistakable fashion, and, in the original, which was shown

centre of interest. In a scheme of tones that on the whole is moderately light, so forceful an opposition creates such a demand upon the attention that nothing else can compete with it; but the group has also the strength of position that it owes to its placing on one of a division of thirds, and, that being so, the interest it excites is paramount. By this means unity is established and the composition rendered acceptable.

A minor point in connection with the arrangement, but one which has an appreciable influence upon the appeal, is the way the lines are opposed by counter directional impulses. The line of the landscape against the sky runs upwards from right to left. This line is opposed by the vertical lines of the figure and the legs of the horses, but a more forceful counter-direction is afforded by the slope of the neck and head of the animal on the extreme left. The line formed by the lower edge of the cloud formation runs upward in a direction more or less parallel with the line of the landscape, and this is repeated by the line of the gap above. The lines of the clouds themselves, however, run downwards from right to left or against the sense of direction imparted by the aforesaid edges, and these lines and counter-lines in repetition convey a feeling of rhythm that adds an attractive swing and go to the more vital aesthetic impressions of light and space.

The retention of the delicate tones of a mackerel sky, too, is something of an achievement from the technical point of view. It is by no means easy and involves the employment of a colour-sensitive emulsion in conjunction with a suitable light filter. The exposure must be pretty accurate and development of the negative not allowed to proceed too far or much of the gradation will be lost. Here, there is no misjudgment, and the effect is all that could be desired.

"MENTOR."

at the last autumn exhibition of the London Salon of Photography, it was even more marked than it is in the reproduction. It was a 20x16 print on Gevaluxe of exceedingly fine quality, and the intensity of tone in the blacks and the brilliance of the lights compelled universal admiration. Personally, I liked it immensely, and found my opinion of it was shared by everyone with whom I came in contact.

But the attraction arising from the contrast of extremes of tone again is useful in making clear the function of the group in acting as the primary

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

THE point I put forward in these columns in the issue for the 8th of this month to the effect that sunshine is a necessity in snow pictures is a fact that has been appreciated, for it seems to be evident from the further batch of winter subjects reproduced on the opposite page, where in almost every case it has been incorporated as an essential feature.

Light and Shade.

So much is encouraging, but there is still a tendency to include a good deal more subject material than is strictly necessary, and much of it consists of darks that the pictures would be better without.

For one thing, this excess of dark notes is inclined to make the contrasts much too steep, and, for another, it prevents the more delicate contrast of the play of sunlight and shadow upon the snow from telling as it should. Moreover, it tends to obscure the rendering of the surface textures on which a good deal of the pictorial attraction depends, and, altogether, it is a thing to be very carefully guarded against.

In No. 1, "St. Ives—Arches," by F. Longbottom, we have an example. The tones of the snow in shadow and those in light are very well recorded, and the relative values of snow and sky are just about right, but there are masses of dark tone in the foliage and in the buildings which outweigh the somewhat slender pull of the light and shade on the snow and quite prevent it from assuming more than a very minor function in the subject. Instead of which it should be the main attraction.

Suitable and Otherwise.

As a matter of fact, the subject is one which, I feel, is scarcely the sort of thing that is suitable for a picture of snow. Too much is made of the buildings, the surrounding foliage, and the remainder of the setting, and what there is of snow—not a great deal, anyhow—does not get a chance.

On the other hand, if the intention is to make a subject of the buildings under winter conditions, not enough is made of them and too much of the snow. In any event, I do not think the material is very promising either

as a snow study or a representation of architecture, nor do I think—although one never knows—that there would be much chance of a real honest snow picture of the type I have in mind anywhere in the immediate neighbourhood.

To get the real thing, it is necessary to go out into those parts of the countryside that do not betray the hand of man. There may be exceptions, of course, but No. 3, "Snow in the Sun," by W. B. Price, is more the sort of thing I visualise. Even here, I do not care for the dark—whatever it is—in the bottom left-hand corner, and the value of the sunlight on the snow-covered bush is inclined to be overshadowed by the pull of the darks of the tree-trunks above.

The bush, the immediate foreground, and the snow in shadow on the left are excellent features, but it might be as well if more foreground were included; if the bush were rendered on a somewhat smaller scale; if the sky were excluded as well as most of the trees in the upper section of the background; and if more were made of the snow in shadow on the left, the dark at the base on the left being avoided altogether.

Foreground Subjects.

This means, in effect, turning the picture into a foreground study purely and simply, and, as I said in my former article, it is a safe general rule to go for this sort of thing in preference to trying to handle landscapes or scenes of a more open character.

For example, I doubt very much if more could be made of a scene of the nature of No. 6, "A Wintry Ride," by L. V. Headley, but it hasn't a fraction of the appeal of No. 3, and, quite frankly, if I were given the job of trying to make a picture out of it to compete with "Snow in the Sun," I should give it up. It is not that there is anything wrong with the photography. The sky could, perhaps, do with a bit more tone, but as a snow subject, or even as a study of a winter scene, it is of too open a character to offer any possibility of really successful treatment.

Much the same might be said of No. 5, "800th Christmas," by B. McAuley, although, in this case, the trees are not quite so insistent and the

snow is rather more in evidence.

Texture and Sunlight.

Moreover, in both these examples there is no suggestion of sunshine, and even if they were able to stand up to the others in comparison, as far as choice of subject were concerned, they would still be at a serious disadvantage on this account.

The rendering of the snow in No. 4, "Winter," by Vernon Sambrook, with its play of sunshine and shadow, compares with them very favourably. The lights have tone and texture, and these qualities are enhanced by the adjoining shadows. In this aspect, the picture is as good as its neighbour, No. 3, for the latter could do with a length of foreground similarly shadowed, but I do not feel that the trestle erection is at all a satisfactory adjunct, and am pretty positive that something better in the way of material could have been found in the near vicinity, avoiding the structure in question.

No. 2, "After the Storm," by G. E. Cowell, has the advantage of sunshine, but partakes, to some extent, of the disabilities mentioned in connection with Nos. 5 and 6. Like the curate's egg, it is good in parts, the light and shade below the fallen tree being a delightful feature, but the rest, with its intense darks, its superfluous sky and widespread scope, makes a serious drawback.

Pictorial Motive.

Unfortunately, there is not enough of the good to make a picture. Limiting the subject to that bit below the tree and excluding the light patch underneath the gate includes all that is worth looking at, but it has no hint of form or arrangement and could scarcely be treated to provide a pictorial motive.

And directly any more is added, the question of excess of contrast immediately arises. A limited amount of dark may be permissible, but it should show some gradation and be so placed that it harmonises with the remainder of the composition. Reference to No. 3, assuming a quarter of an inch be trimmed from the top, will convey some idea of what ought to be done, and, if another opportunity arises, its treatment might be kept in mind.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

IMPROVISING AN ENLARGER—III.

THERE is little more that can be said in the way of general information for those who contemplate rigging up an enlarger. I remember making two myself in the earlier days of my photography. The first, including the lens, cost about five shillings, but it had to be used by daylight, and enlarged from quarter-plate to 10×8 only. The second one was made from an old studio camera, and was a complete failure because I never suc-

The Family Pet.

A Halt by the Way.

ceeded in stopping all the holes and cracks in the woodwork.

We want something a bit better nowadays. Standards have risen in both apparatus and work. At the same time a simple but soundly designed and constructed enlarger may well be capable of giving first-class results, just as some of the finest pictures are captured by the cheapest cameras. Performance is more important than appearance or cost.

A good deal in the way of structural details can be learnt by studying illustrations in advertisements and catalogues, but better still is the examination of actual instruments. Even those who have nothing of the sort themselves can often find a friend who has. It is not considered the correct thing to have enlargers shown and demonstrated by a dealer, and then to tell him you wanted to see them only to learn how to make one for yourself. Some dealers have little sense of humour.

I am often asked to name a book which has the necessary drawings, diagrams and instructions for making an enlarger,

Preparations.

but I know of no such book now in print. With such a great variety of enlargers as there are, a book attempting to deal with the subject would be large and costly, and no one would care to pay the price on the chance that one of the models described might perhaps suit him.

In a week or so I hope to give the drawings and working instructions of the one made by the friend I mentioned, but I warn readers in advance that it will not suit all of them. No enlarger that could possibly be designed would suit everybody. But this one will certainly appeal, with or without modifications, to a good many. Others who want something quite different will be able to grasp the general principles which are involved, and which I have described at some length; and all should be encouraged by the success of one who was quite a novice at this side of photography.

Meanwhile I show here some reproductions of typical enlargements he has made, and they are sufficient to suggest the excellent quality of the work.

I have just space enough for a few words on a remark of a correspondent who said I had given no reasons for saying that the see-saw method of developing roll films was inferior

Cromarty, Scotland.

to the tank method. Briefly, the former is more liable to cause mechanical damage; it is wearisome, and tends to curtailing the operations; it necessitates a proper dark-room, and even then there is risk of light-fog. W. L. F. W.

"The A.P." Monthly Competitions

PRIZES AND RULES.

To encourage pictorial outlook and good technique in the photographic work of our readers in all parts of the world.

(I) For Advanced Workers.

This class is open to all amateur photographers.

FIRST PRIZE.—One guinea in cash or "A.P." silver plaque (optional).

SECOND PRIZE.—Half a guinea in cash or "A.P." bronze plaque (optional).

THIRD PRIZE.—Five shillings in cash.

A special prize of five shillings in cash for the best mounted picture.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.

(2) Prints must be mounted, but not framed.

(3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.

(4) Prints may be of any size and by any process, and must be the competitor's own work throughout.

(5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

(II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 10x8 in., and can be by contact or enlargement by any process, and may be mounted.

(2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.

(3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.

(4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

(III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 6x4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.

(2) The exposure must have been made by the competitor, but developing and printing may be the work of others.

(3) No prints can be criticised or returned.

(4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

General Rules.

(1) Any number of prints may be entered, but each print must have on the back the appropriate coupon (see advertisement pages) the date of which must be

within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communication on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are dispatched on the fifteenth of the month following the announcement of the awards.

The closing date for the December competition is Friday, December 31st, and for the January competition, Monday, January 31st.

A new Competition, of interest to workers in colour photography, will be announced next week.

MAKING BETTER SNAPSHOTS-30

By DAVID CHARLES.

This article is the thirtieth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. Pleasing "line-studies" are now available in every town and village.

THE idea appears to come as something of a surprise to many that trees in winter can be interesting, or even beautiful. Yet for the comparative beginner who is desirous of introducing into his snapshots some of the qualities of good composition the study of tree formation can teach a very great deal, at a time when other outdoor subjects are often difficult to find. The photographer who begins to read the commentaries of those who have already reached the pinnacles of artistic endeavour is liable to find himself puzzled by some of the technical art terms. Many people, in fact, find it as difficult to determine what is meant by "arrangement of lines and masses" as applied to a subject they are photographing as some of their would-be advisers find it hard to believe that their explanatory terms are not obviously simple.

Natural Pattern.

But in trees we have a kind of subject which for the most part consists in summer of great simple masses, and in winter of almost pure lines! It is practically the only subject of natural origin which ever forms patterns of

almost pure lines, and that is why it is so valuable to those who can best understand a point when it is taken by itself, separately from other considerations.

Design Makes Interest.

It is not by any means all these conglomerations of lines which are beautiful, or even interesting. The thing is to select those which are so, and then to endeavour to understand why they please or intrigue the eye while other very similar subjects do not. What is the character in these collections of lines which constitutes the appeal? Not that they are trees; it is simply the pattern or "design" of the lines. For it will be discovered that in those which are interesting there is a distinct sense of design. In other words, the most prominent lines flow in one or more

Fig. 2. When line formations repeat rhythmically they attract. The detail of these trees so repeats, and their trunks follow rhythmically with the cloud formation.

Fig. 3. Although apparently crude, there is "rhythm" in the principal lines of these branches. They help to convey the sense of "wintry desolation."

directions in a more or less rhythmical pattern. Not with a regular mechanical "repeat" as in a manufactured wall-paper or textile; but there is at least a little of that repetition of a "motif with variations" which is the appeal of so much music. When the branches and twigs form a mere jumble against the background of sky the effect is ugly and has no attractiveness whatever.

Studying Lines.

I would advise any reader who finds himself in the least degree puzzled about composition to make a start upon this simple subject. One of the strongest obstacles to the understanding of and the introduction of proper composition into photographs is the possession of the means for making so many pictures in such a short space of time. Even if one can remember and select the different rules for different subjects, it is both difficult and bewildering to have to apply them all in rapid succession. No other art is, or can be, learnt like that. It can only result in most cases in "mental indigestion." But right on the doorstep there is a type of subject which at the present time is ideal for studying the single aspect of the pictorial effect of lines, as I have attempted to show in my illustrations.

Fig. 4. The same scene without the tree is shown for practical comparison of the effect.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

The Art of Film Presentation By ROBERT W. NEWBY.

NOW of all the year is the time when the amateur cinematographer uses his projector most. At this season, when friends forgather more than at any other time, it is natural that the home cinema should take its place as a premier form of home entertainment, and the cinematographer should be called upon to "justify his existence" by providing ciné shows for the gatherings in his own home. For the fortunate few who have a room in their house set aside for use as a projection theatre, such home ciné shows require little preparation, since all the fitments, as projector, screen, lights, and so forth, are permanently fixed and do not have to be set up specially for the occasion. The majority of showmen, however, are not so fortunate. By far the greater proportion are faced every time a show is required with the task of transforming into a ciné theatre—often at a moment's notice—an ordinary living-room, which is probably of an inconvenient shape and already encumbered with furniture. For them it is essential to have a pre-arranged plan for preparing the projection theatre for action, in the shortest possible time and with the minimum of inconvenience and trouble.

Preparing the Auditorium.

For an informal party, the aim when arranging the room for a ciné show should be to secure as much realism as possible and yet retain the homely atmosphere. For this reason supply comfortable arm-chairs for your audience as far as space will allow, and, unless you have a large number present, arrange the chairs informally in small groups with occasional tables with ash-trays interspersed among them.

If a silver screen is being used chairs should not be placed too far from the central line joining the projector and screen, otherwise those in side seats may be watching a very poorly-illuminated picture due to the directional surface of the screen. The actual arrangement of the theatre must, of course, differ in every case to suit the particular room being used.

Watch the Temperature.

As far as possible keep the room at an equable temperature; not cold, nor yet too hot and stuffy, and, above all things, avoid draughts. The ideal method of heating is by the use of two or three small electric radiators placed in the corners. The room is then warmed all round.

The electrical arrangements of your theatre should be given careful atten-

tion in order that the annoyance and possible danger of a fuse may be avoided. If it is possible, arrange to be able to switch the room lights on and off from the projector. This can be easily effected by the use of a two-way switch. One or two small table lamps which can be controlled from the projector give a pleasant soft light and can be used for intervals. A string of small coloured lights, such as are used for decorating Christmas trees, and which can be bought for three or four shillings, would add a professional touch if draped round the screen. They should be controlled from the projector operating table so that they can be switched off while showing.

Permanent Preparations.

A semi-permanent job may be made of the electric wiring by fitting up a small switchboard for controlling the various lights, and wiring with flexes cut to the required lengths and fitted with the appropriate plugs and connections, so that on future occasions the room may be wired up in a very short time.

Avoid overloading your connecting wires, which may lead to a fuse or even a fire. Ordinary household flex is made to stand a current of 5 amperes. For lighting loads, electrical power used in watts is given by the product of the voltage and the current in amperes. Hence, on 200-volt mains, for example, you can safely pass current through 5-amp. flex to lamps or radiators totalling 1,000 watts.

Choosing the Programme.

Remember that you are not merely "the man at the projector," but that you are the showman and producer, and that the whole success of the show will depend entirely on your choice of films and the way in which you present them.

The type of audience to whom you are showing should, of course, be the deciding factor in your choice of programme. For example, if Uncle Bill, who is a golf maniac, is coming, show a short film on golf with noted professionals in play in his honour. If Mr. and Mrs. Smith, recently returned from a cruise to the West Indies, are to be there,

A good, if difficult, action subject for the bird-lover is suggested above, where gulls and pigeons are shown competing for food. It is only in winter, when birds can be tempted to face the camera by offers of delicacies, that subjects of this kind are at all plentiful.

show a documentary of that part of the world. It is sure to be appreciated and may call forth from them an interesting spontaneous running commentary.

You will probably be wanting to show some of your own films. If you are one of the greater proportion of amateur cinematographers who make films of family interest for their own personal value as records, and have not the time or inclination to become a "serious worker" and produce really professional results, then put your own films first on the programme. Any technical deficiencies in them will not then be shown up by the excellence (technically) of a professional film, as might have been the case if such a film were shown first.

Put Cartoons Early.

A cartoon makes a good start to the programme as it requires little concentration and gives members of the audience a chance to settle themselves comfortably before your own films are shown. These may be followed by a news reel or more cartoons and an interval, after which a long professional film could be presented. The choice of such a "feature" film must, of course,

depend entirely on the type of audience and time available.

Some sort of musical accompaniment to the films is very desirable and is almost indispensable in the case of certain films, such as Mickey Mouse cartoons, which were originally talkies. Elaborate synchronisation is not required; a Mickey Mouse or Silly Symphony will swing along quite happily to the strains of any lively dance tune, but will seem very flat if projected silently.

Sound Equipment.

The sound equipment used must depend on your resources, but the ideal arrangement is two gramophone turntables with electric pick-ups connected through mixing potentiometer faders to an amplifier or wireless set. The loud-speaker should, if possible, be placed behind the screen. If this rather complicated apparatus is not available, ordinary gramophones would suffice, or even the radio alone might be made to yield a suitable programme of light music for the occasion, but the disadvantages of the lack of continuity of the latter are obvious.

Unless numerous practice projections

of the film can be made, it is almost impossible to synchronise suitable music accurately with it. For that reason when choosing your records for use as a musical accompaniment, it is best to steer a middle course and keep clear of pieces with very noisy or very quiet, soulful music, so that the more blatant mistakes, such as playing a "hot" rumba at the most poignant moment of the drama, may be avoided! If it is possible to have just one pre-view of the films so that the story is known, certain selected records may be kept handy for use at the more dramatic moments.

Some Minor Points.

Lastly, if the show is in the nature of a party, arrange your programme so as to have several short intervals during which the chocolates and cigarettes and so forth may be circulated among the audience. Do not switch on the main lights for these intervals as the sudden glare can be very unpleasant, but rather use the subdued lighting from shaded table lamps. Play a cheery record during the interval, but do not allow it to be so loud as to prevent comfortable conversation.

Exhibitions and Competitions

CURRENT AND FUTURE.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, December 31. Rules in this issue.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Winter Snapshot Competition for users of the Purina Special Camera. £100 in cash prizes. Particulars and entry forms from R. F. Hunter, Ltd., 51, Gray's Inn Road, W.C.1.

Bertram Mills' Circus Competition.—Cash prizes for photographs taken during the performances from December 22 to January 25. Extra prizes for winning prints by readers of "The A.P." Particulars in "The A.P." of December 8.

International Photographic Exhibition in Debrecen (Hungary).—Open, January. (Aszmann Ferenc, Ferenc Josef ut 27, Debrecen, Hungary.)

Xle International Fotosalon "Iris".—Open, January, 1938. (F. Geeraerts, Brederodestr, 22, Antwerp, Belgium.)

Preston S.S. (P.S.) Thirteenth Annual Open Photographic Exhibition.—Entry forms, January 7; exhibits, January 14. (F. Wells, 65, Powis Road, Preston, Lancs.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

Aberdeen P.A. International Exhibition of Photographic Art.—Entries, January 15; open, February

5-26. (Miss Hilda M. Bailey, 63, Watson Street, Aberdeen.)

Stockton-on-Tees and D.C.C. First Annual Salon of Photography.—Entries, January 15; open, February 7-9, inclusive. (J. Greenwell, 9, Birkley Road, Norton-on-Tees.)

Nottingham and Notts P.S. 34th Annual Exhibition.—Entries, January 21; open, February 7-12. (T. G. Earp, 14, Brushfield Street, Hyson Green, Nottingham.)

Leicester and Leicestershire Photographic Society's International Exhibition of Pictorial Photography.—February 21-March 12. Last day for entries, January 29. (H. Foscutt, 19, Doncaster Road, Leicester.)

Ilford P.S. International Exhibition of Photography.—Entries, January 31; open, March 7-12. (H. D. J. Cole, 11, Woodlands Road, Ilford, Essex.)

L.M.S. (London) P.S. 13th Annual Exhibition.—Entries, February 1; open, March 7-12. (Hon. Exhibition Secretary, L.M.S. (London) Photographic Society, 1, Euston Square, London, N.W.1.)

Birmingham P.S. 47th Annual Exhibition.—Entry forms, February 3; exhibits, February 5; open, February 26-March 12. (E. H. Bellamy, 20, Waterloo Street, Birmingham, 2.)

City of London and Cripplegate P.S. Thirty-third Annual Photographic Exhibition.—Entries, Monday, February 7; open, March 7-12. (R. C. Dye, The Flats, Chesham Road, Wigginton, Tring, Herts.)

Southampton C.C. Open Exhibition.—Entries, February 14; open, February 28-March 19. (Cecil

Chandless, Hon. Exhibition Sec., Southampton C.C., 30, Carlton Crescent, Southampton.)

Runcorn C.C. Open Exhibition.—Entries, February 18; open, March 23-26. (R. J. Edwards, 1, Waterloo Road, Runcorn, Cheshire.)

Australian Commemorative Salon of Photography (Sydney).—Entries, February 25; open, April. (Hon. Exhibition Secretary, H. B. Leckie, 30, Pitt Street, Sydney, New South Wales, Australia.)

Edinburgh Photographic Society 76th Annual Open Exhibition.—Open, March 9-April 2; entries, February 28. (John S. Rodger, 16, Royal Terrace, Edinburgh.)

Scottish Photographic Federation 30th Scottish National Salon.—Entries, March 2; open, April 2-16. (Percy H. Cartwright, 52, High Street, Galashiels, Scotland.)

Bishop Auckland P.S. Annual Salon.—Entries, March 7; open, March 16-19. (W. G. Ridley, 19, Ravensworth Avenue, Bishop Auckland, Co. Durham.)

Hackney P.S. 49th Annual Exhibition.—Entries, March 7; open, March 30-April 2. (Walter Selie, 9, Fairlight Avenue, Woodford Green, Essex.)

Derby Railway Institute P.S. Twenty-third Annual Exhibition.—Entries, March 31; open, April 25-30. (J. Radford, Dowlerry, Spinney Road, Chaddesdon, Derby.)

XVIIe Salon International de Photographie de Belgique.—Entries, April 1; open, May-October. (J. Lejeune, 70, Avenue Van Becelaere, Boitsfort, Brussels, Belgium.)

"The A.P." Monthly Competitions

AWARDS FOR NOVEMBER.

A STILL greater number of prints than usual were entered in the competitions for November, and in the Advanced Workers' and Beginners' Sections they constituted a record. Again the standard of merit was extremely high. The awards are as follows:—

ADVANCED WORKERS' SECTION.

First Prize.—"Handymen," by Dr. Frank R. Neubert, St. Mary's Hospital, Portsmouth.

Second Prize.—"Adventure," by L. S. Bendle, The Hostel, Shell Haven, Near Stanford-le-Hope, Essex.

Third Prize.—"Barley Harvest," by Miss M. Whitcombe, Kateshill House, Bewdley, Worcs.

Mounting Prize.—"A Mountain Stream," by R. Cook, The Coppice, Cromwell Road, Fulwood, Preston.

Certificates of Merit.—"Decoration," by James C. Gilchrist, Lanover, Perthshire; "St. Martin's," by E. A. Fordham, Brambley, Courtfield Rise, West Wickham; "Seagulls at Sunset," by Dr. S. D. Jouhar, 50, Crown Road, Twickenham, Middx.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1 and Class 2 respectively. Those awarded Honourable Mention are as follows:—

Eric Anderson (Bridge of Allan); L. S. Bendle (Stanford-le-Hope); J. H. Clark (London, S.E.); (2) R. Cook (Preston, Lancs.); J. D. Drinkwater (Llanfarcha); Arthur G. Dell (W. Norwood, S.E.); G. F. Eales (St. Budeaux); L. Freedman (London, S.E.); P. J. Gorom (Newport, Mon.); George Hilleard (Bromley); Dr. S. D. Jouhar (Twickenham); E. T. Mills (High Wycombe); Dr. Frank R. Neubert (Portsmouth); Mrs. K. M. Parsons (Reading); F. Alsop Partington (Farnworth); C. C. Redshaw (Dorchester); John Sicluna (Malta); T. G. Skipper (Sutton); F. J. Taylor (Blyth); (2) K. C. Wadham (Beckenham).

INTERMEDIATE SECTION.

First Prize.—"Toddy Pots," by M. D. Vincent, Jambo, No. 7, Bishop Waller Avenue, Sullivan's Garden, Mylapore, Madras, S. India.

Second Prize.—"The Annexe, May, 1937," by J. H. Holmes, 21, Anselm Road, Hatch End, Middx.

Certificates of Merit.—"Independence," by W. G. Busby, 33, Sutton Road, Hull; "Man Friday," by Stanley L. Connor, 22, Prospect Street, Reading; "Ponte Sant Angelo, Rome," by R. Dugdill, 62, Lamberhurst Road, West Norwood, London, S.E.27; "The Sail," by W. L. Young, Stanley House, Haywood, Lancs.

BEGINNERS' SECTION.

First Prize.—"Floodlight," by S. F. Goodyear, 80, Welton Avenue, Polygo, Southampton.

Second Prize.—"Traffic in Tunisia," by Mrs. H. Rounthwaite, Battery Road, Cowes, I.O.W.

Certificates of Merit.—"Excelsior!" by H. Haydon, 25, Mount Pleasant Road, Hastings; "Wings in the Sky," by J. H. Kelly, 10, Dale Street, Liverpool, 2; "Good Fun," by Gustaf Larsson, Lindövägen 14, Norrköping, Sweden; "The Sight of Hong Kong," by Robert Loo, c/o W. T. Lum (Cosons), 11, Queen's Road, Central (1st Floor), Hong Kong; "Early Morning, Derwentwater," by J. B. Woodham, 19, Beach Avenue, Whitley Bay, Northumberland.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Photography at the Circus.—Photographers with fast lenses are reminded that hand cameras may be used at all performances of Bertram Mills' Circus at Olympia without special permit. Our Christmas Number and last week's issue both contained details of a Prize Competition arranged by the management of the Circus for the best photograph taken at this year's show and submitted on or before January 22nd. The first prize will be a cheque for five guineas, and this, and all other prizes, too, will be doubled if the prizewinner is a reader of "The A.P." and affixes a coupon from a current issue to the back of his print. For further details readers are referred to the previous announcements mentioned above.

The Edinburgh House Press, of Edinburgh House, 2, Eaton Gate, S.W.1, has recently published a most interesting book, entitled "The African and the Cinema," by L. A. Notcutt and G. C. Latham. It is an account of an experiment in the application of the cinema to educational work among the Bantu, and besides dealing with the technical side of the project describes the reactions of the native African to the various subjects depicted, and makes suggestions of considerable value to both educator and missionary. This book, interesting to the general reader as well as to the specialist, is published at 3s. 6d., or may be had post free for 4s. from the above address.

Cyclists will flock to Sadler's Wells Theatre on January 10th, when "Hodites" (Mr. Nevill Whall, Assistant Secretary of the Cyclists' Touring Club) will lecture on "The Grandest Game of All." His subject will be Continental touring by bicycle, and the lecture will be illustrated by views taken in monochrome and in Dufaycolor, in all parts of Europe. Tickets of admission, including an illustrated souvenir programme, can be obtained from the Cyclists' Touring Club, 3, Craven Hill, W.2. Envelopes should be addressed to the Secretary, and marked "Hodites" in the top left-hand corner.

We have received a letter from one of our readers, Mr. Ian McNeil, who has recently purchased a Karat camera, in which he expresses a wish to get in touch with other users of this particular miniature camera. In this way valuable photographic friendships may be formed, and if any amateur photographers who employ the Karat for the production of their pictures would like to communicate with Mr. McNeil his address is 38, Woodstock Road, London, N.W.11.

The 1938 edition of the "Leica Manual," which contains 600 pages and 450 illustrations, has been completely revised and reset throughout. It contains ten entirely new chapters, including one on the hypersensitising

of films, and gives the latest information available on the newer colour processes now coming into use in the United States. So extensive is the revision that the new edition may almost be regarded as a new book, and we have no doubt that the 1938 edition, which undoubtedly lives up to the claim that it is a one-volume library on miniature-camera work, will be as heartily welcomed as its predecessor. The "Leica Manual" is obtainable at 21s. from any bookseller or photographic dealer, or direct at 21s. 6d. post free from the Fountain Press, 19, Cursitor Street, E.C.4.

"The Coloured Counties," by Charles Bradley Ford, is a short survey of the English landscape and its antiquities, and will be of interest to any reader, whether he be a photographer or not. But besides providing the photographer with many suggestions for "happy hunting-grounds" for landscape and record work, this book has a special technical interest as being illustrated throughout with excellent reproductions in colour photogravure from Dufaycolor originals. "The Coloured Counties" may be obtained from any bookseller at 8s. 6d., and is published by Messrs. B. T. Batsford, Ltd., of 15, North Audley Street, W.1.

Our readers who live in the neighbourhood of Reigate should note that Mr. Paul C. de Save, 72, High Street, Reigate,

is attempting to form a photographic society in that town. A meeting has been arranged for 8.15 p.m. on the 11th January, at "The Old Wheel," Church Street, Reigate, when the question of the formation of a society in the Borough is to be considered. Messrs. Kodak have kindly promised to send a speaker to address the meeting on "The Scope of the Photographic Society." All amateurs who are interested will be very welcome, but Mr. de Save would appreciate a note from those who intend to be present in order that he may make arrangements for suitable accommodation.

From Saturday, January 1st, to the 6th, inclusive, the Regent Street Polytechnic is holding a New Year's Fête, in aid of the Rebuilding Fund and the Social Work of the Institute, in the Great Portland Street Extension. The Exhibition will be open daily from 5 p.m. to 10.30 p.m. (Sundays excepted), and a Gala Dance in the Portland Hall will be held on New Year's Eve. Amongst the various displays and sideshows will be an exhibition of modern photography, including a collection of enlargements by James Jarché, and we would advise our readers who have the opportunity of doing so to pay this a visit. Admission is by programme, 3d. each day.

Mr. F. J. Taylor, 11, First Avenue, Blyth, has once again succeeded in securing the Wallace Heaton guinea award for the best print in this week's "Speed and Action" competition. Unfortunately, Mr. Taylor did not give his print any title. Full particulars of these weekly competitions will be found in our advertisement pages.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulae and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulae issued by the leading manufacturers of plates, films and papers.

These facts and formulae are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5 1/2 x 3 1/2 x 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

106. Makers' Formulæ: Developers for Granville Lantern Plates

M.Q. for Gaslight Plates.

Metol	25 grs. (2.8 grm.)
Sodium sulphite (anhydrous)	330 grs. (37.5 grm.)
Hydroquinone	90 grs. (10 grm.)
Sodium carbonate (anhydrous)	245 grs. (28 grm.)
Potassium bromide	15 grs. (1.7 grm.)
Water to	20 oz. (1,000 c.c.)

If crystallised sulphite or carbonate is used, take 660 grs. (75 grm.) in place of the amount shown.

For use dilute with an equal volume of water. Development is complete in 45 secs. at 65° Fahr. (18° C.).

This developer can be obtained in packet form.

M.Q. for Bromide Plates.

Metol	15 grs. (1.7 grm.)
Sodium sulphite (anhydrous)	330 grs. (37.5 grm.)
Hydroquinone	60 grs. (6.8 grm.)

Sodium carbonate (anhydrous)	285 grs. (32.5 grm.)
Potassium bromide	15 grs. (1.7 grm.)
Water to	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double above quantity. If crystallised carbonate is used, take 770 grs. (87.5 grm.).

For use dilute with its own bulk of water. Develop bromide lantern plates for not less than 2 minutes at 65° Fahr. (18° C.).

This developer is available in packet form.

Amidol for Bromide Plates.

Sodium sulphite (anhydrous)	220 grs. (25 grm.)
Amidol	50 grs. (5.7 grm.)
Potassium bromide	10 grs. (1.1 grm.)
Water to	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take double amount shown above.

This developer is used at full strength, and plates should be developed for not less than 2 minutes at 65° Fahr. (18° C.).

This developer is available in packet form.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

3½ × 2½ Press Camera.

Can you give me the names of any press-type cameras in 3½ × 2½ size? I like this type of instrument, which seems to me the ideal camera for all snapshot work, but do not wish to use 9 × 12 cm. or 5 × 4 in. plates. H. Z. (Birmingham.)

The only 3½ × 2½ focal-plane cameras that are at present being produced are, so far as we know, the Dallmeyer Speed camera, which costs £18 18s. with f/2.9 Pentac lens, and the Adams' Vaido hand or stand camera, which costs £36 without lens. A large number of 3½ × 2½ press cameras, however, have been made in the past, and many of these are still available second-hand. An enquiry at any large dealer would probably bring you the offer of half-a-dozen different models to choose from.

Film Speed or Development?

I have been using a concentrated one-solution developer in a tank, but recently tried an M.Q. developer as an experiment, exposing two films identically on the same subject and developing one in each developer. That treated with M.Q. looks as if it could have done with half the exposure, as it is by far the denser of the two. Does film-speed depend on the developer used?

N. M. R. (Tring.)

The correct exposure for a film does depend to some small extent upon the developer used. With all ordinary developers the change in speed is unnoticeably small, but, as you have doubtless learned from the many references to it in our columns, the average fine-grain developer definitely does slow the film.

Your comparison films have received development to such extremely different extents that it is practically impossible to say which has received the fuller exposure. The much greater density of the negative developed in the M.Q. developer is largely, if not entirely, due to the fact that it has been developed to about three times the contrast of the comparison negative. If the two had been developed to the same contrast we do not think you would have seen any difference between them.

Reflex for Portraiture.

I use a ¼-pl. reflex for artificial-light portraiture, and find the focal-plane shutter inconvenient, as it is noisy and has no speeds below 1/20th sec., while when set at "Time" I cannot expose accurately for less than ½ sec. I want a range of speeds from ½ to 1/20th. What camera would you suggest?

A. P. (London.)

It is a drawback of the focal-plane shutter that it is by no means ideal for giving slow mechanical exposures. For exposures less than about 1/10th second the only course is for the shutter to open rapidly and close rapidly after a certain interval, and this is generally managed by setting the shutter for time and using a pneumatic release with a time valve. We think, on the whole, it is better to use a twin-lens camera with a shutter of the Compur type. Nowadays, however, these are not made in quarter-plate size as far as we know, but we see no reason why a smaller negative should not answer your purpose.

But if you would rather retain your present camera, we would remind you that a studio shutter, as used by professional photographers, can probably be fitted to it. These are silent shutters permanently set at "Bulb," and with a very little practice can be made to give exposures up to about 1/8th sec.

Washing Films.

For some time now I have been in the habit of washing my films by holding them under a fast-running tap for a good ten minutes. Do you regard this as a good system for forcing the hypo out, or is any other method preferable?

A. E. H. (Wiltshire.)

If the water had access to the whole of the film for ten minutes we should think that you have no cause for anxiety on the score of permanence. At the same time, you cannot force hypo solution out of the gelatine. It must have time to diffuse out. It would be better to leave the film lying in water for a few minutes and then change it into clean water. If this is done at least six or eight times at intervals of four or five minutes the film will probably be quite safe.

Lens for Ciné Projector.

I am making myself a projector for 9.5-mm. film, and have seen a 4-in. f/4.5 anastigmat advertised for sale at a reasonable price. Would this be suitable for my needs? A. G. F. (Cheltenham.)

The lens you mention is quite unsuitable for use in a ciné projector, as it has much too long a focal length. This would mean that the projector would require to be a very long way from the screen to give a picture of reasonable size. In addition, the whole design of the lens is such as to suit it for quite different purposes.

Fixing in Tank.

I have a daylight tank, the instructions with which tell me to remove the film for fixing. Why cannot this operation be done in the tank?

A. E. A. (Glamorganshire.)

We do not know what particular tank you have, and your best plan would be to communicate with its makers, describe the tank and ask them whether it is suitable for fixing as well as for development. We see no reason why it should not be, provided it is thoroughly rinsed out afterwards.

Failure with Home-Made Enlarger.

I enclose a small enlargement made in my home-made enlarger; as you will see, it is not sharp, though the negative is. The film was sandwiched between two glass plates laid on the film-rollers of my camera and illuminated by an electric lamp behind an opal glass. The lens was used at f/22 to get maximum sharpness.

W. B. C. (Ilford.)

The negative you send is an excellent one for enlarging, but the print is, of course, hopelessly blurred. This shows that there is something wrong with the construction or arrangement of your enlarger. You make no mention of focussing the image, and with the film so close to its normal position in the camera, the usual modern instrument with lens-cell focussing will not have extension enough for making any but enormous enlargements. We suggest that you focus the image first on the easel where the bromide paper is to be placed, and, having done this, we do not see why the enlargements should not be satisfactory, and you will be able to use your lens at or near full aperture.

Projectors.

What is the difference between an episcopo, an epidiascope, an optiscopo and a projector?

H. B. D. (London.)

"Projector" is a general term covering any instrument that will project an image on to a screen, no matter whether the original of the image is a lantern slide, a microscope slide, a negative, a print, a picture postcard, or a ciné film. An episcopo is an instrument for projecting an image by reflected light, and is designed for projecting an image of a print or other opaque object. An epidiascope is an episcopo that is also fitted for projecting by transmitted light, as required in projecting lantern slides or colour transparencies. "Optiscopo" is the trade name for the lantern-slide projectors made by Messrs. Ensign, Ltd.

OVERHAULED AND GUARANTEED . .

used cameras and projectors, particularly when purchased from careful enthusiasts like ourselves are practically as good as a new one from the manufacturer. The guarantee given by R. G. Lewis (Ciné) is no mere slip of printed paper to be thrown away, but a personally signed assurance that the camera or projector is absolutely perfect. Coupled with our guarantee is the two years for maintenance that we offer on certain instruments or machines. Have a perfect outfit to start with and let us keep it perfect for you.

SOUND-ON-FILM PROJECTORS :

Gebescope Model B, with dual loud speakers for D.I.N. or S.M.P.E. film, complete and in perfect order, with manufacturer's guarantee. £89 0 0
Amprosound Model M, 500-watt lamp, detachable A.C. D.C. amplifier, output 8 watts, 10-in. loud-speaker, complete in two carrying-cases. In as new condition. £89 0 0
Victor Animatophone, 500-watt lamp, special film trip action, also for silent films, 5 watts output. Excellent condition. £87 10 0

SEND FOR FULL LIST—FREE

16-mm. SILENT PROJECTORS :

Siemens Standard Projector, bronze finish, built for commercial use and will stand any amount of hard wear, 250-watt lamp, fan cooling and ammeter, stills device, motor rewind with resistance and travelling-case. As new. £45 0 0
Siemens Standard, black model, 200-watt lamp, otherwise as above. Good condition. £35 0 0
Ampro Model J.D., 500-watt lamp, reverse, still picture device, Ventura cooling system, separate lamp switch, high-speed motor rewind, with case. As new. £33 10 0
Ampro Model K.D., 750-watt lamp, specification as above, but with large diameter lens and built-in pilot light, with case. £39 0 0

Kodascope Model C, 100-watt lamp, complete with resistance. Good condition. £8 17 6
Zeiss Kinox, 800-ft. model, 375-watt lamp, fan cooled, totally enclosed, very silent, complete with transformer. Perfect condition. £72 10 0

2½% CASH DISCOUNT ON USED CINE APPARATUS

DUAL PROJECTORS :

Ditmar Duo for 8-mm. and 9.5-mm. films, 500-watt lamp, stills, reverse, illuminated panels for threading in the dark, with resistance. As new. £29 10 0
Bolex G916, for 9.5-mm. and 16-mm. films, 500-watt lamp, reverse, stills, complete with spare parts and resistance. Very good order. £31 10 0
Siemens Sixteen-Nine, Beta film movement, ammeter, 250-watt lamp, 35-mm. Dallmeyer lens, built-in resistance, case. As new. £47 10 0
Bolex D.A., for 9.5-mm. and 16-mm. film, will show notched films, reverse, stills, 40-mm. Meyer Kinon lens, with resistance. Very little used. £23 10 0

9.5-mm. PROJECTORS :

Bolex-Paillard P.A., 400-watt lamp, reverse and stills, motor rewind, 35-mm. lens, with resistance. £19 10 0
Pathe Imp, one-amp. model, motor, super attachment, resistance. Good condition. £4 12 6

8-mm. PROJECTORS :

Eumig P.III, 250-watt lamp, 25-mm. Meyer Kinon lens, motor rewind, quick-feed sprockets. As new. £14 10 0

CAMERAS :

16-mm. Zeiss Movikon, f/1.4 Zeiss Sonnar lens, coupled focussing, 4 speeds, hand crank, adjustable shutter sector, visual inspection aperture and many other features, with case. As new. £77 10 0
16-mm. Zeiss Movikon, as above, but not such nice condition. £67 10 0

STRAIGHTFORWARD AND CONFIDENTIAL HIRE PURCHASE FACILITIES

16-mm. Paillard-Bolex Model 16H, turret head, visual focussing, self-threading, 1-in. f/1.5 Dallmeyer Speed lens and leather case. As new. £39 0 0
9.5-mm. Pathe de Luxe, f/1.5 Hugo Meyer lens, with carrying-case. £9 17 6
8-mm. Bell & Howell Straight Eight, speeds, 8, 16, 24 and 32, f/2.5 T.T. & H. lens, case. £9 17 6

FACTS AND
FORMULÆ

The AMATEUR PHOTOGRAPHER DIARY

AND HANDBOOK FOR 1938

This useful little handbook contains, in addition to the usual diary pages—one week to the page—over fifty pages of facts and formulæ for the keen camera user. Information is given on developing, fixing baths, mountants, and finishing negatives and prints. Numerous reference tables dealing with hyperfocal distances, enlarging, screen distances for lantern projection and exposures are included, as well as sections for exposure records and personal memoranda.

Size 3½ x 5½ inches, well printed, neatly and strongly bound in leather cloth, with back loop pencil and round corners.

Photograms of the Year 1938

Eighty-one Charming Pictures

"Photograms of the Year" has grown in popularity with the passing years. The volume for 1938 is the forty-third annual issue and will increase the prestige which this outstanding compilation has won throughout the world for its wide range of subjects, their technical excellence, and the quality of reproduction. It contains examples of the best work of the world's foremost camera artists, specially chosen by Mr. F. J. Mortimer, Editor of "The Amateur Photographer."

Keen photographers will welcome the opportunity afforded by "Photograms" of viewing the finest and most modern expressions of photographic art, and of observing the latest technical developments.

The volume contains an editorial résumé on "The Year's Work," and contributions by well-known writers in many foreign countries. Critical notes of the photographs, and an up-to-date Directory of British Photographic Societies are also included.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 260, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, G.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

ACCESSORIES

BELLOWS.—All sizes stocked; lowest prices; camera cases.—A. Maskens & Sons, 12a, Cross St., Islington, London, N.1. [0083]

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to LILFEE & SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

CINEMATOGRAPH APPARATUS

PROJECTORS, Films, from 5/-, 8, 9.5, 16 and 35 mm., Screens, Cameras; everything for movies; your inspection invited.—Illustra Enterprises, 159, Wardour St., London, W.1; open every evening this week until 8 p.m. [1041]

NEWMAN-SINCLAIR Auto. Kine Camera, regular model, many extras, specially adapted Nature photography; 5 lenses; perfect condition, £130.—Box 4374, c/o "The Amateur Photographer." [1039]

EXCHANGE AND WANTED

WANTED.—Modern Second-hand Cameras; cash or exchange allowance.—Murray, 146, Queen St., Glasgow. [0054]

PRE-STOCKTAKING CLEARANCE LINES

GRAVURE ENLARGING FRAME

The Gravure Enlarging Frame will give enlargements a unique distinctiveness, so that they will cease to be "just photos." It enables a variety of novel and extremely beautiful effects to be easily produced on ANY enlarging paper and with ANY vertical enlarger. For 10x8, 8 1/2 x 6 1/2 and 6 1/2 x 4 1/2 in. enlargements. Complete with 3 Printing Screens and 3 masks. List price £2 2s.

To clear **£1:5:0** Post free

FLOODLAMP REFLECTOR

A reflector designed for use with Photoflood lamps. By using the switch on the base of the reflector the "life" of the lamp is economised—it need not be switched on until it is ready for making the exposure.

A few shop-soiled, to clear

7/6

including 9 ft. flex.

Postage 1s. extra.

Nitraphot Photoflood Lamps, B.C. fitting, 2s. 6d. each. Please state voltage when ordering.

"DIST" DISTANCE METER

The "Dist" Distance Meter shows exactly the distance of the subject from the camera. The range of the instrument is from 1 ft. 3 in. to 50 ft. Complete in hand-sewn leather case. List price £2 10s. Shop-soiled Model

35/-

A Few Second-hand "PRINSEN" ELECTRIC EXPOSURE METERS

The "Prinsen" Electric Exposure Meter is the simplest exposure meter controlled by a photo-electric cell. Carried easily in the vest pocket, the "Prinsen" needs only one simple adjustment to the H. & D. speed scale for the plate or film to be used.

To clear, post free **£2:2:0**

Including Leather Case

35-mm. FILM DEVELOPING FRAME

For Contax, Leica, Retina, etc., Film.

Simplifies the processing of Leica, Contax, Retina and all 35-mm. films of similar length. The film emulsion side out, is wound on the frame and placed in any 10x8 developing tray with sufficient solution to cover the film. List price 10s. 6d.

To clear **7/6**

Postage 6d. extra.

THE SECRETS OF TRICK PHOTOGRAPHY

A New Book Just Out

PRICE 7/6

Postage 6d. extra

There are hundreds of secrets in photographic practice that have never

before been described in photographic text-books. This is the first time that a book so comprehensive and with such an unlimited supply of new photographic ideas has been offered. A book that will help numerous photographers over the high wall that divides the "ordinary" from the "unusual." A book about which the German critics wrote: "We have hardly known any publication in the field of practical photography as instructive and as interesting as Croy's 'Secrets of Trick Photography'." **SANDS HUNTER & CO., LTD., 37, Bedford St., Strand, London, W.C.2.**

WALLACE HEATON'S NEW YEAR SALE

A record year's trade at our shops now reacts to the benefit of the bargain buyer. We are simply loaded out with apparatus taken in part exchange for new apparatus, and this must be cleared to make way for new stocks. There's photographic and ciné apparatus of every description, also enlargers and accessories. We have no junk. Every instrument we are offering is in well-cared-for condition and will give excellent service. Don't miss this chance of a good solid bargain. Every item costing £10 or more is supplied with a printed three-year guarantee—ample proof of the faith we have in these astounding offers. You can buy on easy terms too—just pick out the bargain which interests you and we will quote the first instalment which secures it on our confidential plan. Start the New Year with a resolve to save a few pounds. Write at once and share this big value!

PICTURE MAKING AT HOME...

Photograph on Selo Hypersensitive Panchromatic Roll Film. Exposure: $\frac{1}{25}$ sec. at F/5.6, with 2 Selo Lighting Sets at 3 feet from the subject

Something *different* for you to do these long dark evenings—the fascinating hobby of night photography. With the wonderful speed of Selo Hypersensitive Panchromatic Roll Film and Ilford Hypersensitive Panchromatic Plates it's just as simple as picture making by day. Round your own home a host of opportunities awaits you—the family and your friends, social gatherings that you will be glad to look back on. So don't let dust settle on your camera now that winter is here!
